## Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.

## Table of Contents

<b>CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW .....</b>	<b>70</b>
1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW	70
1.1.1. Installation process	71
The installation process with installer-provisioned infrastructure	72
The installation process with user-provisioned infrastructure	73
Installation process details	73
1.1.2. Verifying node state after installation	74
Installation scope	76
1.1.3. OpenShift Local overview	76
1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS	76
<b>CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS .....</b>	<b>79</b>
2.1. SELECTING A CLUSTER INSTALLATION TYPE	79
2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?	79
2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?	80
2.1.3. Do you want to use existing components in your cluster?	80
2.1.4. Do you need extra security for your cluster?	81
2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION	81
2.3. PREPARING YOUR CLUSTER FOR WORKLOADS	81
2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS	82
<b>CHAPTER 3. DISCONNECTED INSTALLATION MIRRORING .....</b>	<b>86</b>
3.1. ABOUT DISCONNECTED INSTALLATION MIRRORING	86
3.1.1. Creating a mirror registry	86
3.1.2. Mirroring images for a disconnected installation	86
3.2. CREATING A MIRROR REGISTRY WITH MIRROR REGISTRY FOR RED HAT OPENSIFT	86
3.2.1. Prerequisites	86
3.2.2. Mirror registry for Red Hat OpenShift introduction	87
3.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift	87
3.2.4. Updating mirror registry for Red Hat OpenShift from a local host	88
3.2.5. Mirroring on a remote host with mirror registry for Red Hat OpenShift	89
3.2.6. Updating mirror registry for Red Hat OpenShift from a remote host	91
3.2.7. Uninstalling the mirror registry for Red Hat OpenShift	91
3.2.8. Mirror registry for Red Hat OpenShift flags	91
3.2.9. Mirror registry for Red Hat OpenShift release notes	93
3.2.9.1. Mirror registry for Red Hat OpenShift 1.3.8	93
3.2.9.2. Mirror registry for Red Hat OpenShift 1.3.7	93
3.2.9.3. Mirror registry for Red Hat OpenShift 1.3.6	93
3.2.9.4. Mirror registry for Red Hat OpenShift 1.3.5	94
3.2.9.5. Mirror registry for Red Hat OpenShift 1.3.4	94
3.2.9.6. Mirror registry for Red Hat OpenShift 1.3.3	94
3.2.9.7. Mirror registry for Red Hat OpenShift 1.3.2	94
3.2.9.8. Mirror registry for Red Hat OpenShift 1.3.1	94
3.2.9.9. Mirror registry for Red Hat OpenShift 1.3.0	94
3.2.9.9.1. New features	95
3.2.9.9.2. Bug fixes	95
3.2.9.10. Mirror registry for Red Hat OpenShift 1.2.9	95
3.2.9.11. Mirror registry for Red Hat OpenShift 1.2.8	95
3.2.9.12. Mirror registry for Red Hat OpenShift 1.2.7	96
3.2.9.12.1. Bug fixes	96
3.2.9.13. Mirror registry for Red Hat OpenShift 1.2.6	96

3.2.9.13.1. New features	96
3.2.9.14. Mirror registry for Red Hat OpenShift 1.2.5	96
3.2.9.15. Mirror registry for Red Hat OpenShift 1.2.4	96
3.2.9.16. Mirror registry for Red Hat OpenShift 1.2.3	96
3.2.9.17. Mirror registry for Red Hat OpenShift 1.2.2	97
3.2.9.18. Mirror registry for Red Hat OpenShift 1.2.1	97
3.2.9.19. Mirror registry for Red Hat OpenShift 1.2.0	97
3.2.9.19.1. Bug fixes	97
3.2.9.20. Mirror registry for Red Hat OpenShift 1.1.0	97
3.2.9.20.1. New features	97
3.2.9.20.2. Bug fixes	97
3.2.10. Troubleshooting mirror registry for Red Hat OpenShift	98
3.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION	98
3.3.1. Prerequisites	99
3.3.2. About the mirror registry	99
3.3.3. Preparing your mirror host	100
3.3.3.1. Installing the OpenShift CLI by downloading the binary	100
Installing the OpenShift CLI on Linux	100
Installing the OpenShift CLI on Windows	101
Installing the OpenShift CLI on macOS	101
3.3.4. Configuring credentials that allow images to be mirrored	102
3.3.5. Mirroring the OpenShift Container Platform image repository	104
3.3.6. The Cluster Samples Operator in a disconnected environment	107
3.3.6.1. Cluster Samples Operator assistance for mirroring	107
3.3.7. Mirroring Operator catalogs for use with disconnected clusters	108
3.3.7.1. Prerequisites	109
3.3.7.2. Extracting and mirroring catalog contents	109
3.3.7.2.1. Mirroring catalog contents to registries on the same network	109
3.3.7.2.2. Mirroring catalog contents to airgapped registries	111
3.3.7.3. Generated manifests	113
3.3.7.4. Post-installation requirements	114
3.3.8. Next steps	114
3.3.9. Additional resources	115
3.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUGIN	115
3.4.1. About the oc-mirror plugin	115
3.4.2. About the mirror registry	116
3.4.3. Prerequisites	117
3.4.4. Preparing your mirror hosts	117
3.4.4.1. Installing the oc-mirror OpenShift CLI plugin	117
3.4.4.2. Configuring credentials that allow images to be mirrored	118
3.4.5. Creating the image set configuration	120
3.4.6. Mirroring an image set to a mirror registry	121
3.4.6.1. Mirroring an image set in a partially disconnected environment	122
3.4.6.1.1. Mirroring from mirror to mirror	122
3.4.6.2. Mirroring an image set in a fully disconnected environment	123
3.4.6.2.1. Mirroring from mirror to disk	123
3.4.6.2.2. Mirroring from disk to mirror	124
3.4.7. Configuring your cluster to use the resources generated by oc-mirror	125
3.4.8. Updating your mirror registry	126
3.4.9. Image set configuration parameters	127
3.4.10. Image set configuration examples	131
Use case: Including arbitrary images and helm charts	131
Use case: Including specific Operator versions	132

3.4.11. Command reference for oc-mirror	132
<b>CHAPTER 4. INSTALLING ON ALIBABA</b>	<b>134</b>
4.1. PREPARING TO INSTALL ON ALIBABA CLOUD	134
4.1.1. Prerequisites	134
4.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud	134
4.1.3. Registering and Configuring Alibaba Cloud Domain	134
4.1.4. Supported Alibaba regions	135
4.1.5. Next steps	135
4.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES	135
4.2.1. Creating the required RAM user	135
4.2.2. Configuring the Cloud Credential Operator utility	140
4.2.3. Next steps	141
4.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD	141
4.3.1. Prerequisites	142
4.3.2. Internet access for OpenShift Container Platform	142
4.3.3. Generating a key pair for cluster node SSH access	142
4.3.4. Obtaining the installation program	144
4.3.5. Creating the installation configuration file	145
4.3.6. Generating the required installation manifests	147
4.3.7. Creating credentials for OpenShift Container Platform components with the ccoctl tool	147
4.3.8. Deploying the cluster	150
4.3.9. Installing the OpenShift CLI by downloading the binary	151
Installing the OpenShift CLI on Linux	151
Installing the OpenShift CLI on Windows	152
Installing the OpenShift CLI on macOS	152
4.3.10. Logging in to the cluster by using the CLI	153
4.3.11. Logging in to the cluster by using the web console	153
4.3.12. Telemetry access for OpenShift Container Platform	154
4.3.13. Next steps	154
4.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS	154
4.4.1. Prerequisites	155
4.4.2. Internet access for OpenShift Container Platform	155
4.4.3. Generating a key pair for cluster node SSH access	156
4.4.4. Obtaining the installation program	157
4.4.4.1. Creating the installation configuration file	158
4.4.4.2. Generating the required installation manifests	160
4.4.4.3. Creating credentials for OpenShift Container Platform components with the ccoctl tool	160
4.4.4.4. Installation configuration parameters	163
4.4.4.4.1. Required configuration parameters	163
4.4.4.4.2. Network configuration parameters	165
4.4.4.4.3. Optional configuration parameters	166
4.4.4.4.4. Additional Alibaba Cloud configuration parameters	171
4.4.4.5. Sample customized install-config.yaml file for Alibaba Cloud	174
4.4.4.6. Configuring the cluster-wide proxy during installation	175
4.4.5. Deploying the cluster	177
4.4.6. Installing the OpenShift CLI by downloading the binary	178
Installing the OpenShift CLI on Linux	179
Installing the OpenShift CLI on Windows	179
Installing the OpenShift CLI on macOS	180
4.4.7. Logging in to the cluster by using the CLI	180
4.4.8. Logging in to the cluster by using the web console	181
4.4.9. Telemetry access for OpenShift Container Platform	181

4.4.10. Next steps	182
4.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS	182
4.5.1. Prerequisites	182
4.5.2. Internet access for OpenShift Container Platform	183
4.5.3. Generating a key pair for cluster node SSH access	183
4.5.4. Obtaining the installation program	185
4.5.5. Network configuration phases	186
4.5.5.1. Creating the installation configuration file	186
4.5.5.2. Generating the required installation manifests	187
4.5.5.3. Installation configuration parameters	188
4.5.5.3.1. Required configuration parameters	188
4.5.5.3.2. Network configuration parameters	190
4.5.5.3.3. Optional configuration parameters	192
4.5.5.4. Sample customized install-config.yaml file for Alibaba Cloud	196
4.5.5.5. Configuring the cluster-wide proxy during installation	198
4.5.6. Cluster Network Operator configuration	199
4.5.6.1. Cluster Network Operator configuration object	200
defaultNetwork object configuration	201
Configuration for the OpenShift SDN CNI cluster network provider	201
Configuration for the OVN-Kubernetes CNI cluster network provider	202
kubeProxyConfig object configuration	204
4.5.7. Specifying advanced network configuration	205
4.5.8. Configuring hybrid networking with OVN-Kubernetes	206
4.5.9. Deploying the cluster	208
4.5.10. Installing the OpenShift CLI by downloading the binary	209
Installing the OpenShift CLI on Linux	209
Installing the OpenShift CLI on Windows	210
Installing the OpenShift CLI on macOS	210
4.5.11. Logging in to the cluster by using the CLI	211
4.5.12. Logging in to the cluster by using the web console	211
4.5.13. Telemetry access for OpenShift Container Platform	212
4.5.14. Next steps	212
4.6. INSTALLING A CLUSTER ON ALIBABA CLOUD INTO AN EXISTING VPC	213
4.6.1. Prerequisites	213
4.6.2. Using a custom VPC	213
4.6.2.1. Requirements for using your VPC	214
4.6.2.2. VPC validation	214
4.6.2.3. Division of permissions	214
4.6.2.4. Isolation between clusters	214
4.6.3. Internet access for OpenShift Container Platform	215
4.6.4. Generating a key pair for cluster node SSH access	215
4.6.5. Obtaining the installation program	217
4.6.5.1. Creating the installation configuration file	218
4.6.5.2. Installation configuration parameters	219
4.6.5.2.1. Required configuration parameters	219
4.6.5.2.2. Network configuration parameters	221
4.6.5.2.3. Optional configuration parameters	223
4.6.5.2.4. Additional Alibaba Cloud configuration parameters	227
4.6.5.3. Sample customized install-config.yaml file for Alibaba Cloud	230
4.6.5.4. Generating the required installation manifests	232
4.6.5.5. Configuring the Cloud Credential Operator utility	232
4.6.5.6. Creating credentials for OpenShift Container Platform components with the ccoctl tool	233
4.6.6. Deploying the cluster	236

4.6.7. Installing the OpenShift CLI by downloading the binary	237
Installing the OpenShift CLI on Linux	238
Installing the OpenShift CLI on Windows	238
Installing the OpenShift CLI on macOS	239
4.6.8. Logging in to the cluster by using the CLI	239
4.6.9. Logging in to the cluster by using the web console	240
4.6.10. Telemetry access for OpenShift Container Platform	240
4.6.11. Next steps	241
4.7. UNINSTALLING A CLUSTER ON ALIBABA CLOUD	241
4.7.1. Removing a cluster that uses installer-provisioned infrastructure	241
<b>CHAPTER 5. INSTALLING ON AWS</b> .....	<b>243</b>
5.1. PREPARING TO INSTALL ON AWS	243
5.1.1. Prerequisites	243
5.1.2. Requirements for installing OpenShift Container Platform on AWS	243
5.1.3. Choosing a method to install OpenShift Container Platform on AWS	243
5.1.3.1. Installing a cluster on installer-provisioned infrastructure	243
5.1.3.2. Installing a cluster on user-provisioned infrastructure	244
5.1.4. Next steps	244
5.2. CONFIGURING AN AWS ACCOUNT	244
5.2.1. Configuring Route 53	244
5.2.1.1. Ingress Operator endpoint configuration for AWS Route 53	245
5.2.2. AWS account limits	246
5.2.3. Required AWS permissions for the IAM user	248
5.2.4. Creating an IAM user	256
5.2.5. IAM Policies and AWS authentication	257
5.2.5.1. Default permissions for IAM instance profiles	257
5.2.5.2. Specifying an existing IAM role	259
5.2.5.3. Using AWS IAM Analyzer to create policy templates	259
5.2.6. Supported AWS Marketplace regions	260
5.2.7. Supported AWS regions	261
5.2.7.1. AWS public regions	261
5.2.7.2. AWS GovCloud regions	261
5.2.7.3. AWS C2S Secret region	262
5.2.7.4. AWS China regions	262
5.2.8. Next steps	262
5.3. MANUALLY CREATING IAM FOR AWS	262
5.3.1. Alternatives to storing administrator-level secrets in the kube-system project	262
5.3.2. Manually create IAM	263
5.3.3. Mint mode	266
5.3.4. Mint mode with removal or rotation of the administrator-level credential	267
5.3.5. Next steps	267
5.4. INSTALLING A CLUSTER QUICKLY ON AWS	267
5.4.1. Prerequisites	267
5.4.2. Internet access for OpenShift Container Platform	268
5.4.3. Generating a key pair for cluster node SSH access	268
5.4.4. Obtaining the installation program	270
5.4.5. Deploying the cluster	271
5.4.6. Installing the OpenShift CLI by downloading the binary	273
Installing the OpenShift CLI on Linux	274
Installing the OpenShift CLI on Windows	274
Installing the OpenShift CLI on macOS	275
5.4.7. Logging in to the cluster by using the CLI	275

5.4.8. Logging in to the cluster by using the web console	276
5.4.9. Telemetry access for OpenShift Container Platform	276
5.4.10. Next steps	277
5.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS	277
5.5.1. Prerequisites	277
5.5.2. Internet access for OpenShift Container Platform	278
5.5.3. Generating a key pair for cluster node SSH access	278
5.5.4. Obtaining an AWS Marketplace image	280
5.5.5. Obtaining the installation program	281
5.5.6. Creating the installation configuration file	281
5.5.6.1. Installation configuration parameters	283
5.5.6.1.1. Required configuration parameters	283
5.5.6.1.2. Network configuration parameters	284
5.5.6.1.3. Optional configuration parameters	286
5.5.6.1.4. Optional AWS configuration parameters	291
5.5.6.2. Minimum resource requirements for cluster installation	295
5.5.6.3. Tested instance types for AWS	296
5.5.6.4. Tested instance types for AWS on 64-bit ARM infrastructures	296
5.5.6.5. Sample customized install-config.yaml file for AWS	297
5.5.6.6. Configuring the cluster-wide proxy during installation	299
5.5.7. Deploying the cluster	301
5.5.8. Installing the OpenShift CLI by downloading the binary	302
Installing the OpenShift CLI on Linux	302
Installing the OpenShift CLI on Windows	303
Installing the OpenShift CLI on macOS	303
5.5.9. Logging in to the cluster by using the CLI	304
5.5.10. Logging in to the cluster by using the web console	304
5.5.11. Telemetry access for OpenShift Container Platform	305
5.5.12. Next steps	305
5.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS	306
5.6.1. Prerequisites	306
5.6.2. Internet access for OpenShift Container Platform	306
5.6.3. Generating a key pair for cluster node SSH access	307
5.6.4. Obtaining the installation program	309
5.6.5. Network configuration phases	309
5.6.6. Creating the installation configuration file	310
5.6.6.1. Installation configuration parameters	311
5.6.6.1.1. Required configuration parameters	312
5.6.6.1.2. Network configuration parameters	313
5.6.6.1.3. Optional configuration parameters	315
5.6.6.1.4. Optional AWS configuration parameters	320
5.6.6.2. Minimum resource requirements for cluster installation	324
5.6.6.3. Tested instance types for AWS	325
5.6.6.4. Tested instance types for AWS on 64-bit ARM infrastructures	325
5.6.6.5. Sample customized install-config.yaml file for AWS	326
5.6.6.6. Configuring the cluster-wide proxy during installation	328
5.6.7. Cluster Network Operator configuration	330
5.6.7.1. Cluster Network Operator configuration object	330
defaultNetwork object configuration	331
Configuration for the OpenShift SDN CNI cluster network provider	331
Configuration for the OVN-Kubernetes CNI cluster network provider	332
kubeProxyConfig object configuration	334
5.6.8. Specifying advanced network configuration	335

---

5.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster	336
5.6.10. Configuring hybrid networking with OVN-Kubernetes	338
5.6.11. Deploying the cluster	339
5.6.12. Installing the OpenShift CLI by downloading the binary	341
Installing the OpenShift CLI on Linux	341
Installing the OpenShift CLI on Windows	341
Installing the OpenShift CLI on macOS	342
5.6.13. Logging in to the cluster by using the CLI	342
5.6.14. Logging in to the cluster by using the web console	343
5.6.15. Telemetry access for OpenShift Container Platform	344
5.6.16. Next steps	344
5.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK	344
5.7.1. Prerequisites	344
5.7.2. About installations in restricted networks	345
5.7.2.1. Additional limits	346
5.7.3. About using a custom VPC	346
5.7.3.1. Requirements for using your VPC	346
5.7.3.2. VPC validation	348
5.7.3.3. Division of permissions	349
5.7.3.4. Isolation between clusters	349
5.7.4. Internet access for OpenShift Container Platform	349
5.7.5. Generating a key pair for cluster node SSH access	350
5.7.6. Creating the installation configuration file	352
5.7.6.1. Installation configuration parameters	354
5.7.6.1.1. Required configuration parameters	354
5.7.6.1.2. Network configuration parameters	355
5.7.6.1.3. Optional configuration parameters	357
5.7.6.1.4. Optional AWS configuration parameters	362
5.7.6.2. Minimum resource requirements for cluster installation	366
5.7.6.3. Sample customized install-config.yaml file for AWS	367
5.7.6.4. Configuring the cluster-wide proxy during installation	369
5.7.7. Deploying the cluster	371
5.7.8. Installing the OpenShift CLI by downloading the binary	373
Installing the OpenShift CLI on Linux	373
Installing the OpenShift CLI on Windows	373
Installing the OpenShift CLI on macOS	374
5.7.9. Logging in to the cluster by using the CLI	374
5.7.10. Disabling the default OperatorHub sources	375
5.7.11. Telemetry access for OpenShift Container Platform	375
5.7.12. Next steps	375
5.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC	376
5.8.1. Prerequisites	376
5.8.2. About using a custom VPC	376
5.8.2.1. Requirements for using your VPC	377
5.8.2.2. VPC validation	379
5.8.2.3. Division of permissions	380
5.8.2.4. Isolation between clusters	380
5.8.3. Internet access for OpenShift Container Platform	380
5.8.4. Generating a key pair for cluster node SSH access	381
5.8.5. Obtaining the installation program	383
5.8.6. Creating the installation configuration file	383
5.8.6.1. Installation configuration parameters	385
5.8.6.1.1. Required configuration parameters	385

---

5.8.6.1.2. Network configuration parameters	386
5.8.6.1.3. Optional configuration parameters	388
5.8.6.1.4. Optional AWS configuration parameters	393
5.8.6.2. Minimum resource requirements for cluster installation	397
5.8.6.3. Tested instance types for AWS	398
5.8.6.4. Tested instance types for AWS on 64-bit ARM infrastructures	398
5.8.6.5. Sample customized install-config.yaml file for AWS	399
5.8.6.6. Configuring the cluster-wide proxy during installation	401
5.8.7. Deploying the cluster	403
5.8.8. Installing the OpenShift CLI by downloading the binary	405
Installing the OpenShift CLI on Linux	405
Installing the OpenShift CLI on Windows	405
Installing the OpenShift CLI on macOS	406
5.8.9. Logging in to the cluster by using the CLI	406
5.8.10. Logging in to the cluster by using the web console	407
5.8.11. Telemetry access for OpenShift Container Platform	408
5.8.12. Next steps	408
5.9. INSTALLING A PRIVATE CLUSTER ON AWS	408
5.9.1. Prerequisites	408
5.9.2. Private clusters	409
5.9.2.1. Private clusters in AWS	409
5.9.2.1.1. Limitations	410
5.9.3. About using a custom VPC	410
5.9.3.1. Requirements for using your VPC	410
5.9.3.2. VPC validation	413
5.9.3.3. Division of permissions	413
5.9.3.4. Isolation between clusters	413
5.9.4. Internet access for OpenShift Container Platform	413
5.9.5. Generating a key pair for cluster node SSH access	414
5.9.6. Obtaining the installation program	416
5.9.7. Manually creating the installation configuration file	416
5.9.7.1. Installation configuration parameters	417
5.9.7.1.1. Required configuration parameters	418
5.9.7.1.2. Network configuration parameters	419
5.9.7.1.3. Optional configuration parameters	421
5.9.7.1.4. Optional AWS configuration parameters	426
5.9.7.2. Minimum resource requirements for cluster installation	430
5.9.7.3. Tested instance types for AWS	431
5.9.7.4. Tested instance types for AWS on 64-bit ARM infrastructures	431
5.9.7.5. Sample customized install-config.yaml file for AWS	432
5.9.7.6. Configuring the cluster-wide proxy during installation	434
5.9.8. Deploying the cluster	436
5.9.9. Installing the OpenShift CLI by downloading the binary	438
Installing the OpenShift CLI on Linux	438
Installing the OpenShift CLI on Windows	438
Installing the OpenShift CLI on macOS	439
5.9.10. Logging in to the cluster by using the CLI	439
5.9.11. Logging in to the cluster by using the web console	440
5.9.12. Telemetry access for OpenShift Container Platform	441
5.9.13. Next steps	441
5.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION	441
5.10.1. Prerequisites	441
5.10.2. AWS government regions	442

---

5.10.3. Installation requirements	442
5.10.4. Private clusters	442
5.10.4.1. Private clusters in AWS	443
5.10.4.1.1. Limitations	443
5.10.5. About using a custom VPC	443
5.10.5.1. Requirements for using your VPC	443
5.10.5.2. VPC validation	446
5.10.5.3. Division of permissions	446
5.10.5.4. Isolation between clusters	447
5.10.6. Internet access for OpenShift Container Platform	447
5.10.7. Generating a key pair for cluster node SSH access	447
5.10.8. Obtaining an AWS Marketplace image	449
5.10.9. Obtaining the installation program	450
5.10.10. Manually creating the installation configuration file	451
5.10.10.1. Installation configuration parameters	451
5.10.10.1.1. Required configuration parameters	452
5.10.10.1.2. Network configuration parameters	453
5.10.10.1.3. Optional configuration parameters	455
5.10.10.1.4. Optional AWS configuration parameters	460
5.10.10.2. Minimum resource requirements for cluster installation	464
5.10.10.3. Tested instance types for AWS	465
5.10.10.4. Tested instance types for AWS on 64-bit ARM infrastructures	465
5.10.10.5. Sample customized install-config.yaml file for AWS	466
5.10.10.6. Configuring the cluster-wide proxy during installation	468
5.10.11. Deploying the cluster	470
5.10.12. Installing the OpenShift CLI by downloading the binary	472
Installing the OpenShift CLI on Linux	472
Installing the OpenShift CLI on Windows	472
Installing the OpenShift CLI on macOS	473
5.10.13. Logging in to the cluster by using the CLI	473
5.10.14. Logging in to the cluster by using the web console	474
5.10.15. Telemetry access for OpenShift Container Platform	475
5.10.16. Next steps	475
5.11. INSTALLING A CLUSTER ON AWS INTO A TOP SECRET REGION	475
5.11.1. Prerequisites	475
5.11.2. AWS Top Secret Region	476
5.11.3. Installation requirements	476
5.11.4. Private clusters	476
5.11.4.1. Private clusters in AWS	477
5.11.4.1.1. Limitations	477
5.11.5. About using a custom VPC	478
5.11.5.1. Requirements for using your VPC	478
5.11.5.2. VPC validation	480
5.11.5.3. Division of permissions	481
5.11.5.4. Isolation between clusters	481
5.11.6. Internet access for OpenShift Container Platform	481
5.11.7. Uploading a custom RHCOS AMI in AWS	482
5.11.8. Generating a key pair for cluster node SSH access	484
5.11.9. Obtaining the installation program	486
5.11.10. Manually creating the installation configuration file	487
5.11.10.1. Installation configuration parameters	487
5.11.10.1.1. Required configuration parameters	488
5.11.10.1.2. Network configuration parameters	489

---

5.11.10.1.3. Optional configuration parameters	491
5.11.10.1.4. Optional AWS configuration parameters	496
5.11.10.2. Tested instance types for AWS	500
5.11.10.3. Sample customized install-config.yaml file for AWS	500
5.11.10.4. Configuring the cluster-wide proxy during installation	503
5.11.11. Deploying the cluster	505
5.11.12. Installing the OpenShift CLI by downloading the binary	506
Installing the OpenShift CLI on Linux	507
Installing the OpenShift CLI on Windows	507
Installing the OpenShift CLI on macOS	508
5.11.13. Logging in to the cluster by using the CLI	508
5.11.14. Logging in to the cluster by using the web console	509
5.11.15. Telemetry access for OpenShift Container Platform	509
5.11.16. Next steps	510
5.12. INSTALLING A CLUSTER ON AWS CHINA	510
5.12.1. Prerequisites	510
5.12.2. Installation requirements	511
5.12.3. Internet access for OpenShift Container Platform	511
5.12.4. Private clusters	511
5.12.4.1. Private clusters in AWS	512
5.12.4.1.1. Limitations	512
5.12.5. About using a custom VPC	513
5.12.5.1. Requirements for using your VPC	513
5.12.5.2. VPC validation	515
5.12.5.3. Division of permissions	516
5.12.5.4. Isolation between clusters	516
5.12.6. Generating a key pair for cluster node SSH access	516
5.12.7. Uploading a custom RHCOS AMI in AWS	518
5.12.8. Obtaining the installation program	520
5.12.9. Manually creating the installation configuration file	521
5.12.9.1. Installation configuration parameters	522
5.12.9.1.1. Required configuration parameters	522
5.12.9.1.2. Network configuration parameters	524
5.12.9.1.3. Optional configuration parameters	525
5.12.9.2. Sample customized install-config.yaml file for AWS	530
5.12.9.3. Minimum resource requirements for cluster installation	533
5.12.9.4. Tested instance types for AWS	533
5.12.9.5. Tested instance types for AWS on 64-bit ARM infrastructures	534
5.12.9.6. Configuring the cluster-wide proxy during installation	535
5.12.10. Deploying the cluster	536
5.12.11. Installing the OpenShift CLI by downloading the binary	538
Installing the OpenShift CLI on Linux	538
Installing the OpenShift CLI on Windows	539
Installing the OpenShift CLI on macOS	539
5.12.12. Logging in to the cluster by using the CLI	540
5.12.13. Logging in to the cluster by using the web console	540
5.12.14. Telemetry access for OpenShift Container Platform	541
5.12.15. Next steps	541
5.13. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES	541
5.13.1. Prerequisites	542
5.13.2. Internet access for OpenShift Container Platform	542
5.13.3. Requirements for a cluster with user-provisioned infrastructure	543

5.13.3.1. Required machines for cluster installation	543
5.13.3.2. Minimum resource requirements for cluster installation	544
5.13.3.3. Tested instance types for AWS	544
5.13.3.4. Tested instance types for AWS on 64-bit ARM infrastructures	545
5.13.3.5. Certificate signing requests management	545
5.13.4. Required AWS infrastructure components	546
5.13.4.1. Other infrastructure components	546
5.13.4.2. Cluster machines	554
5.13.4.3. Required AWS permissions for the IAM user	554
5.13.5. Obtaining an AWS Marketplace image	562
5.13.6. Obtaining the installation program	562
5.13.7. Generating a key pair for cluster node SSH access	563
5.13.8. Creating the installation files for AWS	565
5.13.8.1. Optional: Creating a separate /var partition	565
5.13.8.2. Creating the installation configuration file	567
5.13.8.3. Configuring the cluster-wide proxy during installation	569
5.13.8.4. Creating the Kubernetes manifest and Ignition config files	570
5.13.9. Extracting the infrastructure name	572
5.13.10. Creating a VPC in AWS	573
5.13.10.1. CloudFormation template for the VPC	575
5.13.11. Creating networking and load balancing components in AWS	580
5.13.11.1. CloudFormation template for the network and load balancers	584
5.13.12. Creating security group and roles in AWS	592
5.13.12.1. CloudFormation template for security objects	595
5.13.13. Accessing RHCOS AMIs with stream metadata	606
5.13.14. RHCOS AMIs for the AWS infrastructure	606
5.13.14.1. AWS regions without a published RHCOS AMI	608
5.13.14.2. Uploading a custom RHCOS AMI in AWS	609
5.13.15. Creating the bootstrap node in AWS	611
5.13.15.1. CloudFormation template for the bootstrap machine	616
5.13.16. Creating the control plane machines in AWS	620
5.13.16.1. CloudFormation template for control plane machines	624
5.13.17. Creating the worker nodes in AWS	631
5.13.17.1. CloudFormation template for worker machines	634
5.13.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	637
5.13.19. Installing the OpenShift CLI by downloading the binary	638
Installing the OpenShift CLI on Linux	638
Installing the OpenShift CLI on Windows	639
Installing the OpenShift CLI on macOS	639
5.13.20. Logging in to the cluster by using the CLI	639
5.13.21. Approving the certificate signing requests for your machines	640
5.13.22. Initial Operator configuration	643
5.13.22.1. Image registry storage configuration	644
5.13.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure	644
5.13.22.1.2. Configuring storage for the image registry in non-production clusters	645
5.13.23. Deleting the bootstrap resources	645
5.13.24. Creating the Ingress DNS Records	646
5.13.25. Completing an AWS installation on user-provisioned infrastructure	649
5.13.26. Logging in to the cluster by using the web console	650
5.13.27. Telemetry access for OpenShift Container Platform	651
5.13.28. Additional resources	651
5.13.29. Next steps	651
5.14. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED	

INFRASTRUCTURE	651
5.14.1. Prerequisites	652
5.14.2. About installations in restricted networks	652
5.14.2.1. Additional limits	653
5.14.3. Internet access for OpenShift Container Platform	653
5.14.4. Requirements for a cluster with user-provisioned infrastructure	654
5.14.4.1. Required machines for cluster installation	654
5.14.4.2. Minimum resource requirements for cluster installation	654
5.14.4.3. Tested instance types for AWS	655
5.14.4.4. Tested instance types for AWS on 64-bit ARM infrastructures	656
5.14.4.5. Certificate signing requests management	656
5.14.5. Required AWS infrastructure components	656
5.14.5.1. Other infrastructure components	657
5.14.5.2. Cluster machines	665
5.14.5.3. Required AWS permissions for the IAM user	665
5.14.6. Generating a key pair for cluster node SSH access	673
5.14.7. Creating the installation files for AWS	675
5.14.7.1. Optional: Creating a separate /var partition	675
5.14.7.2. Creating the installation configuration file	677
5.14.7.3. Configuring the cluster-wide proxy during installation	679
5.14.7.4. Creating the Kubernetes manifest and Ignition config files	681
5.14.8. Extracting the infrastructure name	683
5.14.9. Creating a VPC in AWS	684
5.14.9.1. CloudFormation template for the VPC	686
5.14.10. Creating networking and load balancing components in AWS	691
5.14.10.1. CloudFormation template for the network and load balancers	695
5.14.11. Creating security group and roles in AWS	702
5.14.11.1. CloudFormation template for security objects	705
5.14.12. Accessing RHCOS AMIs with stream metadata	716
5.14.13. RHCOS AMIs for the AWS infrastructure	716
5.14.14. Creating the bootstrap node in AWS	719
5.14.14.1. CloudFormation template for the bootstrap machine	723
5.14.15. Creating the control plane machines in AWS	728
5.14.15.1. CloudFormation template for control plane machines	732
5.14.16. Creating the worker nodes in AWS	739
5.14.16.1. CloudFormation template for worker machines	742
5.14.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	744
5.14.18. Logging in to the cluster by using the CLI	745
5.14.19. Approving the certificate signing requests for your machines	746
5.14.20. Initial Operator configuration	749
5.14.20.1. Disabling the default OperatorHub sources	750
5.14.20.2. Image registry storage configuration	750
5.14.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure	750
5.14.20.2.2. Configuring storage for the image registry in non-production clusters	751
5.14.21. Deleting the bootstrap resources	752
5.14.22. Creating the Ingress DNS Records	752
5.14.23. Completing an AWS installation on user-provisioned infrastructure	755
5.14.24. Logging in to the cluster by using the web console	756
5.14.25. Telemetry access for OpenShift Container Platform	757
5.14.26. Additional resources	757
5.14.27. Next steps	757
5.15. UNINSTALLING A CLUSTER ON AWS	758
5.15.1. Removing a cluster that uses installer-provisioned infrastructure	758

5.15.2. Deleting AWS resources with the Cloud Credential Operator utility	758
<b>CHAPTER 6. INSTALLING ON AZURE</b>	<b>760</b>
6.1. PREPARING TO INSTALL ON AZURE	760
6.1.1. Prerequisites	760
6.1.2. Requirements for installing OpenShift Container Platform on Azure	760
6.1.3. Choosing a method to install OpenShift Container Platform on Azure	760
6.1.3.1. Installing a cluster on installer-provisioned infrastructure	760
6.1.3.2. Installing a cluster on user-provisioned infrastructure	761
6.1.4. Next steps	761
6.2. CONFIGURING AN AZURE ACCOUNT	761
6.2.1. Azure account limits	761
6.2.2. Configuring a public DNS zone in Azure	764
6.2.3. Increasing Azure account limits	764
6.2.4. Required Azure roles	765
6.2.5. Creating a service principal	765
6.2.6. Supported Azure Marketplace regions	768
6.2.7. Supported Azure regions	768
Supported Azure public regions	768
Supported Azure Government regions	769
6.2.8. Next steps	770
6.3. MANUALLY CREATING IAM FOR AZURE	770
6.3.1. Alternatives to storing administrator-level secrets in the kube-system project	770
6.3.2. Manually create IAM	770
6.3.3. Next steps	773
6.4. INSTALLING A CLUSTER QUICKLY ON AZURE	773
6.4.1. Prerequisites	774
6.4.2. Internet access for OpenShift Container Platform	774
6.4.3. Generating a key pair for cluster node SSH access	774
6.4.4. Obtaining the installation program	776
6.4.5. Deploying the cluster	777
6.4.6. Installing the OpenShift CLI by downloading the binary	780
Installing the OpenShift CLI on Linux	780
Installing the OpenShift CLI on Windows	780
Installing the OpenShift CLI on macOS	781
6.4.7. Logging in to the cluster by using the CLI	781
6.4.8. Telemetry access for OpenShift Container Platform	782
6.4.9. Next steps	782
6.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS	782
6.5.1. Prerequisites	782
6.5.2. Internet access for OpenShift Container Platform	783
6.5.3. Generating a key pair for cluster node SSH access	783
6.5.4. Selecting an Azure Marketplace image	785
6.5.5. Obtaining the installation program	787
6.5.6. Creating the installation configuration file	787
6.5.6.1. Installation configuration parameters	789
6.5.6.1.1. Required configuration parameters	789
6.5.6.1.2. Network configuration parameters	791
6.5.6.1.3. Optional configuration parameters	793
6.5.6.1.4. Additional Azure configuration parameters	797
6.5.6.2. Minimum resource requirements for cluster installation	799
6.5.6.3. Tested instance types for Azure	800
6.5.6.4. Sample customized install-config.yaml file for Azure	801

6.5.6.5. Configuring the cluster-wide proxy during installation	803
6.5.7. Enabling Accelerated Networking during installation	804
6.5.8. Updating manifests for Marketplace installation	805
6.5.9. Deploying the cluster	806
6.5.10. Installing the OpenShift CLI by downloading the binary	808
Installing the OpenShift CLI on Linux	808
Installing the OpenShift CLI on Windows	809
Installing the OpenShift CLI on macOS	809
6.5.11. Logging in to the cluster by using the CLI	809
6.5.12. Telemetry access for OpenShift Container Platform	810
6.5.13. Next steps	810
6.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS	811
6.6.1. Prerequisites	811
6.6.2. Internet access for OpenShift Container Platform	811
6.6.3. Generating a key pair for cluster node SSH access	811
6.6.4. Obtaining the installation program	813
6.6.5. Creating the installation configuration file	814
6.6.5.1. Installation configuration parameters	816
6.6.5.1.1. Required configuration parameters	816
6.6.5.1.2. Network configuration parameters	817
6.6.5.1.3. Optional configuration parameters	819
6.6.5.1.4. Additional Azure configuration parameters	824
6.6.5.2. Minimum resource requirements for cluster installation	826
6.6.5.3. Tested instance types for Azure	827
6.6.5.4. Sample customized install-config.yaml file for Azure	828
6.6.5.5. Configuring the cluster-wide proxy during installation	830
6.6.6. Network configuration phases	831
6.6.7. Specifying advanced network configuration	832
6.6.8. Cluster Network Operator configuration	833
6.6.8.1. Cluster Network Operator configuration object	833
defaultNetwork object configuration	834
Configuration for the OpenShift SDN CNI cluster network provider	835
Configuration for the OVN-Kubernetes CNI cluster network provider	836
kubeProxyConfig object configuration	838
6.6.9. Configuring hybrid networking with OVN-Kubernetes	839
6.6.10. Enabling Accelerated Networking during installation	841
6.6.11. Deploying the cluster	842
6.6.12. Installing the OpenShift CLI by downloading the binary	843
Installing the OpenShift CLI on Linux	843
Installing the OpenShift CLI on Windows	844
Installing the OpenShift CLI on macOS	844
6.6.13. Logging in to the cluster by using the CLI	845
6.6.14. Telemetry access for OpenShift Container Platform	845
6.6.15. Next steps	845
6.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET	846
6.7.1. Prerequisites	846
6.7.2. About reusing a VNet for your OpenShift Container Platform cluster	846
6.7.2.1. Requirements for using your VNet	846
6.7.2.1.1. Network security group requirements	847
6.7.2.2. Division of permissions	848
6.7.2.3. Isolation between clusters	849
6.7.3. Internet access for OpenShift Container Platform	849
6.7.4. Generating a key pair for cluster node SSH access	849

6.7.5. Obtaining the installation program	851
6.7.6. Creating the installation configuration file	852
6.7.6.1. Installation configuration parameters	853
6.7.6.1.1. Required configuration parameters	853
6.7.6.1.2. Network configuration parameters	855
6.7.6.1.3. Optional configuration parameters	857
6.7.6.1.4. Additional Azure configuration parameters	861
6.7.6.2. Minimum resource requirements for cluster installation	863
6.7.6.3. Tested instance types for Azure	864
6.7.6.4. Sample customized install-config.yaml file for Azure	865
6.7.6.5. Configuring the cluster-wide proxy during installation	867
6.7.7. Enabling Accelerated Networking during installation	869
6.7.8. Deploying the cluster	870
6.7.9. Installing the OpenShift CLI by downloading the binary	871
Installing the OpenShift CLI on Linux	871
Installing the OpenShift CLI on Windows	872
Installing the OpenShift CLI on macOS	872
6.7.10. Logging in to the cluster by using the CLI	873
6.7.11. Telemetry access for OpenShift Container Platform	873
6.7.12. Next steps	874
6.8. INSTALLING A PRIVATE CLUSTER ON AZURE	874
6.8.1. Prerequisites	874
6.8.2. Private clusters	874
6.8.2.1. Private clusters in Azure	875
6.8.2.1.1. Limitations	875
6.8.2.2. User-defined outbound routing	875
Private cluster with network address translation	876
Private cluster with Azure Firewall	876
Private cluster with a proxy configuration	876
Private cluster with no internet access	876
6.8.3. About reusing a VNet for your OpenShift Container Platform cluster	877
6.8.3.1. Requirements for using your VNet	877
6.8.3.1.1. Network security group requirements	878
6.8.3.2. Division of permissions	879
6.8.3.3. Isolation between clusters	879
6.8.4. Internet access for OpenShift Container Platform	879
6.8.5. Generating a key pair for cluster node SSH access	880
6.8.6. Obtaining the installation program	881
6.8.7. Manually creating the installation configuration file	882
6.8.7.1. Installation configuration parameters	883
6.8.7.1.1. Required configuration parameters	883
6.8.7.1.2. Network configuration parameters	885
6.8.7.1.3. Optional configuration parameters	887
6.8.7.1.4. Additional Azure configuration parameters	891
6.8.7.2. Minimum resource requirements for cluster installation	893
6.8.7.3. Tested instance types for Azure	894
6.8.7.4. Sample customized install-config.yaml file for Azure	895
6.8.7.5. Configuring the cluster-wide proxy during installation	897
6.8.8. Enabling Accelerated Networking during installation	899
6.8.9. Deploying the cluster	900
6.8.10. Installing the OpenShift CLI by downloading the binary	901
Installing the OpenShift CLI on Linux	901
Installing the OpenShift CLI on Windows	902

Installing the OpenShift CLI on macOS	902
6.8.11. Logging in to the cluster by using the CLI	903
6.8.12. Telemetry access for OpenShift Container Platform	903
6.8.13. Next steps	904
6.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION	904
6.9.1. Prerequisites	904
6.9.2. Azure government regions	904
6.9.3. Private clusters	904
6.9.3.1. Private clusters in Azure	905
6.9.3.1.1. Limitations	906
6.9.3.2. User-defined outbound routing	906
Private cluster with network address translation	906
Private cluster with Azure Firewall	906
Private cluster with a proxy configuration	906
Private cluster with no internet access	907
6.9.4. About reusing a VNet for your OpenShift Container Platform cluster	907
6.9.4.1. Requirements for using your VNet	907
6.9.4.1.1. Network security group requirements	908
6.9.4.2. Division of permissions	909
6.9.4.3. Isolation between clusters	909
6.9.5. Internet access for OpenShift Container Platform	910
6.9.6. Generating a key pair for cluster node SSH access	910
6.9.7. Obtaining the installation program	912
6.9.8. Manually creating the installation configuration file	913
6.9.8.1. Installation configuration parameters	913
6.9.8.1.1. Required configuration parameters	914
6.9.8.1.2. Network configuration parameters	915
6.9.8.1.3. Optional configuration parameters	917
6.9.8.1.4. Additional Azure configuration parameters	922
6.9.8.2. Minimum resource requirements for cluster installation	924
6.9.8.3. Tested instance types for Azure	925
6.9.8.4. Sample customized install-config.yaml file for Azure	926
6.9.8.5. Configuring the cluster-wide proxy during installation	928
6.9.9. Enabling Accelerated Networking during installation	930
6.9.10. Deploying the cluster	930
6.9.11. Installing the OpenShift CLI by downloading the binary	932
Installing the OpenShift CLI on Linux	932
Installing the OpenShift CLI on Windows	933
Installing the OpenShift CLI on macOS	933
6.9.12. Logging in to the cluster by using the CLI	933
6.9.13. Telemetry access for OpenShift Container Platform	934
6.9.14. Next steps	934
6.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES	934
6.10.1. Prerequisites	935
6.10.2. Internet access for OpenShift Container Platform	935
6.10.3. Configuring your Azure project	936
6.10.3.1. Azure account limits	936
6.10.3.2. Configuring a public DNS zone in Azure	939
6.10.3.3. Increasing Azure account limits	939
6.10.3.4. Certificate signing requests management	940
6.10.3.5. Required Azure roles	940
6.10.3.6. Creating a service principal	941
6.10.3.7. Supported Azure regions	943

Supported Azure public regions	943
Supported Azure Government regions	944
6.10.4. Requirements for a cluster with user-provisioned infrastructure	945
6.10.4.1. Required machines for cluster installation	945
6.10.4.2. Minimum resource requirements for cluster installation	945
6.10.4.3. Tested instance types for Azure	946
6.10.5. Selecting an Azure Marketplace image	947
6.10.6. Obtaining the installation program	949
6.10.7. Generating a key pair for cluster node SSH access	949
6.10.8. Creating the installation files for Azure	951
6.10.8.1. Optional: Creating a separate /var partition	951
6.10.8.2. Creating the installation configuration file	954
6.10.8.3. Configuring the cluster-wide proxy during installation	955
6.10.8.4. Exporting common variables for ARM templates	957
6.10.8.5. Creating the Kubernetes manifest and Ignition config files	958
6.10.9. Creating the Azure resource group	961
6.10.10. Uploading the RHCOS cluster image and bootstrap Ignition config file	962
6.10.11. Example for creating DNS zones	963
6.10.12. Creating a VNet in Azure	964
6.10.12.1. ARM template for the VNet	964
6.10.13. Deploying the RHCOS cluster image for the Azure infrastructure	966
6.10.13.1. ARM template for image storage	967
6.10.14. Networking requirements for user-provisioned infrastructure	968
6.10.14.1. Network connectivity requirements	968
6.10.15. Creating networking and load balancing components in Azure	969
6.10.15.1. ARM template for the network and load balancers	970
6.10.16. Creating the bootstrap machine in Azure	975
6.10.16.1. ARM template for the bootstrap machine	976
6.10.17. Creating the control plane machines in Azure	980
6.10.17.1. ARM template for control plane machines	981
6.10.18. Wait for bootstrap completion and remove bootstrap resources in Azure	984
6.10.19. Creating additional worker machines in Azure	985
6.10.19.1. ARM template for worker machines	986
6.10.20. Installing the OpenShift CLI by downloading the binary	990
Installing the OpenShift CLI on Linux	990
Installing the OpenShift CLI on Windows	990
Installing the OpenShift CLI on macOS	991
6.10.21. Logging in to the cluster by using the CLI	991
6.10.22. Approving the certificate signing requests for your machines	992
6.10.23. Adding the Ingress DNS records	995
6.10.24. Completing an Azure installation on user-provisioned infrastructure	996
6.10.25. Telemetry access for OpenShift Container Platform	997
6.11. UNINSTALLING A CLUSTER ON AZURE	997
6.11.1. Removing a cluster that uses installer-provisioned infrastructure	997
<b>CHAPTER 7. INSTALLING ON AZURE STACK HUB</b>	<b>999</b>
7.1. PREPARING TO INSTALL ON AZURE STACK HUB	999
7.1.1. Prerequisites	999
7.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub	999
7.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub	999
7.1.3.1. Installing a cluster on installer-provisioned infrastructure	999
7.1.3.2. Installing a cluster on user-provisioned infrastructure	999
7.1.4. Next steps	999

7.2. CONFIGURING AN AZURE STACK HUB ACCOUNT	1000
7.2.1. Azure Stack Hub account limits	1000
7.2.2. Configuring a DNS zone in Azure Stack Hub	1001
7.2.3. Required Azure Stack Hub roles	1002
7.2.4. Creating a service principal	1002
7.2.5. Next steps	1004
7.3. INSTALLING A CLUSTER ON AZURE STACK HUB WITH AN INSTALLER-PROVISIONED INFRASTRUCTURE	1005
7.3.1. Prerequisites	1005
7.3.2. Internet access for OpenShift Container Platform	1005
7.3.3. Generating a key pair for cluster node SSH access	1006
7.3.4. Uploading the RHCOS cluster image	1007
7.3.5. Obtaining the installation program	1008
7.3.6. Manually creating the installation configuration file	1009
7.3.6.1. Installation configuration parameters	1010
7.3.6.1.1. Required configuration parameters	1010
7.3.6.1.2. Network configuration parameters	1011
7.3.6.1.3. Optional configuration parameters	1013
7.3.6.1.4. Additional Azure Stack Hub configuration parameters	1018
7.3.6.2. Sample customized install-config.yaml file for Azure Stack Hub	1020
7.3.7. Manually manage cloud credentials	1022
7.3.8. Configuring the cluster to use an internal CA	1024
7.3.9. Deploying the cluster	1025
7.3.10. Installing the OpenShift CLI by downloading the binary	1026
Installing the OpenShift CLI on Linux	1026
Installing the OpenShift CLI on Windows	1027
Installing the OpenShift CLI on macOS	1027
7.3.11. Logging in to the cluster by using the CLI	1028
7.3.12. Logging in to the cluster by using the web console	1028
7.3.13. Telemetry access for OpenShift Container Platform	1029
7.3.14. Next steps	1029
7.4. INSTALLING A CLUSTER ON AZURE STACK HUB WITH NETWORK CUSTOMIZATIONS	1030
7.4.1. Prerequisites	1030
7.4.2. Internet access for OpenShift Container Platform	1030
7.4.3. Generating a key pair for cluster node SSH access	1031
7.4.4. Uploading the RHCOS cluster image	1032
7.4.5. Obtaining the installation program	1033
7.4.6. Manually creating the installation configuration file	1034
7.4.6.1. Installation configuration parameters	1035
7.4.6.1.1. Required configuration parameters	1035
7.4.6.1.2. Network configuration parameters	1036
7.4.6.1.3. Optional configuration parameters	1038
7.4.6.1.4. Additional Azure Stack Hub configuration parameters	1043
7.4.6.2. Sample customized install-config.yaml file for Azure Stack Hub	1045
7.4.7. Manually manage cloud credentials	1047
7.4.8. Configuring the cluster to use an internal CA	1049
7.4.9. Network configuration phases	1050
7.4.10. Specifying advanced network configuration	1051
7.4.11. Cluster Network Operator configuration	1052
7.4.11.1. Cluster Network Operator configuration object	1052
defaultNetwork object configuration	1053
Configuration for the OpenShift SDN CNI cluster network provider	1053
Configuration for the OVN-Kubernetes CNI cluster network provider	1054

kubeProxyConfig object configuration	1056
7.4.12. Configuring hybrid networking with OVN-Kubernetes	1057
7.4.13. Deploying the cluster	1059
7.4.14. Installing the OpenShift CLI by downloading the binary	1060
Installing the OpenShift CLI on Linux	1060
Installing the OpenShift CLI on Windows	1061
Installing the OpenShift CLI on macOS	1061
7.4.15. Logging in to the cluster by using the CLI	1062
7.4.16. Logging in to the cluster by using the web console	1062
7.4.17. Telemetry access for OpenShift Container Platform	1063
7.4.18. Next steps	1064
7.5. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES	1064
7.5.1. Prerequisites	1064
7.5.2. Internet access for OpenShift Container Platform	1064
7.5.3. Configuring your Azure Stack Hub project	1065
7.5.3.1. Azure Stack Hub account limits	1065
7.5.3.2. Configuring a DNS zone in Azure Stack Hub	1067
7.5.3.3. Certificate signing requests management	1067
7.5.3.4. Required Azure Stack Hub roles	1067
7.5.3.5. Creating a service principal	1068
7.5.4. Obtaining the installation program	1070
7.5.5. Generating a key pair for cluster node SSH access	1071
7.5.6. Creating the installation files for Azure Stack Hub	1073
7.5.6.1. Manually creating the installation configuration file	1073
7.5.6.2. Sample customized install-config.yaml file for Azure Stack Hub	1075
7.5.6.3. Configuring the cluster-wide proxy during installation	1077
7.5.6.4. Exporting common variables for ARM templates	1078
7.5.6.5. Creating the Kubernetes manifest and Ignition config files	1079
7.5.6.6. Optional: Creating a separate /var partition	1084
7.5.7. Creating the Azure resource group	1086
7.5.8. Uploading the RHCOS cluster image and bootstrap Ignition config file	1086
7.5.9. Example for creating DNS zones	1088
7.5.10. Creating a VNet in Azure Stack Hub	1089
7.5.10.1. ARM template for the VNet	1089
7.5.11. Deploying the RHCOS cluster image for the Azure Stack Hub infrastructure	1089
7.5.11.1. ARM template for image storage	1090
7.5.12. Networking requirements for user-provisioned infrastructure	1090
7.5.12.1. Network connectivity requirements	1090
7.5.13. Creating networking and load balancing components in Azure Stack Hub	1092
7.5.13.1. ARM template for the network and load balancers	1093
7.5.14. Creating the bootstrap machine in Azure Stack Hub	1093
7.5.14.1. ARM template for the bootstrap machine	1095
7.5.15. Creating the control plane machines in Azure Stack Hub	1095
7.5.15.1. ARM template for control plane machines	1096
7.5.16. Wait for bootstrap completion and remove bootstrap resources in Azure Stack Hub	1096
7.5.17. Creating additional worker machines in Azure Stack Hub	1097
7.5.17.1. ARM template for worker machines	1098
7.5.18. Installing the OpenShift CLI by downloading the binary	1098
Installing the OpenShift CLI on Linux	1098
Installing the OpenShift CLI on Windows	1099
Installing the OpenShift CLI on macOS	1099
7.5.19. Logging in to the cluster by using the CLI	1100
7.5.20. Approving the certificate signing requests for your machines	1100

7.5.21. Adding the Ingress DNS records	1103
7.5.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure	1104
7.6. UNINSTALLING A CLUSTER ON AZURE STACK HUB	1105
7.6.1. Removing a cluster that uses installer-provisioned infrastructure	1105
<b>CHAPTER 8. INSTALLING ON GCP</b> .....	<b>1107</b>
8.1. PREPARING TO INSTALL ON GCP	1107
8.1.1. Prerequisites	1107
8.1.2. Requirements for installing OpenShift Container Platform on GCP	1107
8.1.3. Choosing a method to install OpenShift Container Platform on GCP	1107
8.1.3.1. Installing a cluster on installer-provisioned infrastructure	1107
8.1.3.2. Installing a cluster on user-provisioned infrastructure	1108
8.1.4. Next steps	1108
8.2. CONFIGURING A GCP PROJECT	1108
8.2.1. Creating a GCP project	1108
8.2.2. Enabling API services in GCP	1109
8.2.3. Configuring DNS for GCP	1110
8.2.4. GCP account limits	1110
8.2.5. Creating a service account in GCP	1112
8.2.5.1. Required GCP roles	1112
8.2.5.2. Required GCP permissions for installer-provisioned infrastructure	1113
8.2.6. Supported GCP regions	1120
8.2.7. Next steps	1121
8.3. MANUALLY CREATING IAM FOR GCP	1121
8.3.1. Alternatives to storing administrator-level secrets in the kube-system project	1122
8.3.2. Manually create IAM	1123
8.3.3. Mint mode	1125
8.3.4. Mint mode with removal or rotation of the administrator-level credential	1126
8.3.5. Next steps	1126
8.4. INSTALLING A CLUSTER QUICKLY ON GCP	1126
8.4.1. Prerequisites	1126
8.4.2. Internet access for OpenShift Container Platform	1127
8.4.3. Generating a key pair for cluster node SSH access	1127
8.4.4. Obtaining the installation program	1129
8.4.5. Deploying the cluster	1130
8.4.6. Installing the OpenShift CLI by downloading the binary	1132
Installing the OpenShift CLI on Linux	1133
Installing the OpenShift CLI on Windows	1133
Installing the OpenShift CLI on macOS	1134
8.4.7. Logging in to the cluster by using the CLI	1134
8.4.8. Telemetry access for OpenShift Container Platform	1135
8.4.9. Next steps	1135
8.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS	1135
8.5.1. Prerequisites	1135
8.5.2. Internet access for OpenShift Container Platform	1135
8.5.3. Generating a key pair for cluster node SSH access	1136
8.5.4. Obtaining the installation program	1138
8.5.5. Creating the installation configuration file	1139
8.5.5.1. Installation configuration parameters	1140
8.5.5.1.1. Required configuration parameters	1140
8.5.5.1.2. Network configuration parameters	1142
8.5.5.1.3. Optional configuration parameters	1144
8.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1148

---

8.5.5.2. Minimum resource requirements for cluster installation	1152
8.5.5.3. Tested instance types for GCP	1152
8.5.5.4. Using custom machine types	1153
8.5.5.5. Sample customized install-config.yaml file for GCP	1154
8.5.5.6. Configuring the cluster-wide proxy during installation	1156
8.5.6. Using a GCP Marketplace image	1157
8.5.7. Deploying the cluster	1158
8.5.8. Installing the OpenShift CLI by downloading the binary	1160
Installing the OpenShift CLI on Linux	1160
Installing the OpenShift CLI on Windows	1161
Installing the OpenShift CLI on macOS	1161
8.5.9. Logging in to the cluster by using the CLI	1162
8.5.10. Telemetry access for OpenShift Container Platform	1162
8.5.11. Next steps	1163
8.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS	1163
8.6.1. Prerequisites	1163
8.6.2. Internet access for OpenShift Container Platform	1163
8.6.3. Generating a key pair for cluster node SSH access	1164
8.6.4. Obtaining the installation program	1166
8.6.5. Creating the installation configuration file	1167
8.6.5.1. Installation configuration parameters	1168
8.6.5.1.1. Required configuration parameters	1168
8.6.5.1.2. Network configuration parameters	1170
8.6.5.1.3. Optional configuration parameters	1172
8.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1176
8.6.5.2. Minimum resource requirements for cluster installation	1180
8.6.5.3. Tested instance types for GCP	1180
8.6.5.4. Using custom machine types	1181
8.6.5.5. Sample customized install-config.yaml file for GCP	1182
8.6.6. Additional resources	1184
8.6.6.1. Configuring the cluster-wide proxy during installation	1184
8.6.7. Network configuration phases	1185
8.6.8. Specifying advanced network configuration	1186
8.6.9. Cluster Network Operator configuration	1187
8.6.9.1. Cluster Network Operator configuration object	1188
defaultNetwork object configuration	1189
Configuration for the OpenShift SDN CNI cluster network provider	1189
Configuration for the OVN-Kubernetes CNI cluster network provider	1190
kubeProxyConfig object configuration	1192
8.6.10. Deploying the cluster	1193
8.6.11. Installing the OpenShift CLI by downloading the binary	1195
Installing the OpenShift CLI on Linux	1195
Installing the OpenShift CLI on Windows	1195
Installing the OpenShift CLI on macOS	1196
8.6.12. Logging in to the cluster by using the CLI	1196
8.6.13. Telemetry access for OpenShift Container Platform	1197
8.6.14. Next steps	1197
8.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK	1197
8.7.1. Prerequisites	1197
8.7.2. About installations in restricted networks	1198
8.7.2.1. Additional limits	1198
8.7.3. Internet access for OpenShift Container Platform	1198
8.7.4. Generating a key pair for cluster node SSH access	1199

---

8.7.5. Creating the installation configuration file	1201
8.7.5.1. Installation configuration parameters	1203
8.7.5.1.1. Required configuration parameters	1203
8.7.5.1.2. Network configuration parameters	1205
8.7.5.1.3. Optional configuration parameters	1207
8.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1211
8.7.5.2. Minimum resource requirements for cluster installation	1215
8.7.5.3. Tested instance types for GCP	1215
8.7.5.4. Using custom machine types	1216
8.7.5.5. Sample customized install-config.yaml file for GCP	1217
8.7.5.6. Create an Ingress Controller with global access on GCP	1220
8.7.5.7. Configuring the cluster-wide proxy during installation	1221
8.7.6. Deploying the cluster	1222
8.7.7. Installing the OpenShift CLI by downloading the binary	1224
Installing the OpenShift CLI on Linux	1224
Installing the OpenShift CLI on Windows	1225
Installing the OpenShift CLI on macOS	1225
8.7.8. Logging in to the cluster by using the CLI	1226
8.7.9. Disabling the default OperatorHub sources	1226
8.7.10. Telemetry access for OpenShift Container Platform	1227
8.7.11. Next steps	1227
8.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC	1227
8.8.1. Prerequisites	1227
8.8.2. About using a custom VPC	1227
8.8.2.1. Requirements for using your VPC	1228
8.8.2.2. VPC validation	1228
8.8.2.3. Division of permissions	1228
8.8.2.4. Isolation between clusters	1228
8.8.3. Internet access for OpenShift Container Platform	1229
8.8.4. Generating a key pair for cluster node SSH access	1229
8.8.5. Obtaining the installation program	1231
8.8.6. Creating the installation configuration file	1232
8.8.6.1. Installation configuration parameters	1233
8.8.6.1.1. Required configuration parameters	1233
8.8.6.1.2. Network configuration parameters	1235
8.8.6.1.3. Optional configuration parameters	1237
8.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1241
8.8.6.2. Minimum resource requirements for cluster installation	1245
8.8.6.3. Tested instance types for GCP	1245
8.8.6.4. Using custom machine types	1246
8.8.6.5. Sample customized install-config.yaml file for GCP	1247
8.8.6.6. Create an Ingress Controller with global access on GCP	1249
8.8.7. Additional resources	1250
8.8.7.1. Configuring the cluster-wide proxy during installation	1250
8.8.8. Deploying the cluster	1252
8.8.9. Installing the OpenShift CLI by downloading the binary	1254
Installing the OpenShift CLI on Linux	1254
Installing the OpenShift CLI on Windows	1254
Installing the OpenShift CLI on macOS	1255
8.8.10. Logging in to the cluster by using the CLI	1255
8.8.11. Telemetry access for OpenShift Container Platform	1256
8.8.12. Next steps	1256
8.9. INSTALLING A PRIVATE CLUSTER ON GCP	1256

8.9.1. Prerequisites	1256
8.9.2. Private clusters	1257
8.9.2.1. Private clusters in GCP	1257
8.9.2.1.1. Limitations	1258
8.9.3. About using a custom VPC	1258
8.9.3.1. Requirements for using your VPC	1258
8.9.3.2. Division of permissions	1259
8.9.3.3. Isolation between clusters	1259
8.9.4. Internet access for OpenShift Container Platform	1259
8.9.5. Generating a key pair for cluster node SSH access	1260
8.9.6. Obtaining the installation program	1262
8.9.7. Manually creating the installation configuration file	1263
8.9.7.1. Installation configuration parameters	1263
8.9.7.1.1. Required configuration parameters	1264
8.9.7.1.2. Network configuration parameters	1265
8.9.7.1.3. Optional configuration parameters	1267
8.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1272
8.9.7.2. Minimum resource requirements for cluster installation	1276
8.9.7.3. Tested instance types for GCP	1276
8.9.7.4. Using custom machine types	1277
8.9.7.5. Sample customized install-config.yaml file for GCP	1277
8.9.7.6. Create an Ingress Controller with global access on GCP	1280
8.9.8. Additional resources	1281
8.9.8.1. Configuring the cluster-wide proxy during installation	1281
8.9.9. Deploying the cluster	1283
8.9.10. Installing the OpenShift CLI by downloading the binary	1284
Installing the OpenShift CLI on Linux	1284
Installing the OpenShift CLI on Windows	1285
Installing the OpenShift CLI on macOS	1285
8.9.11. Logging in to the cluster by using the CLI	1286
8.9.12. Telemetry access for OpenShift Container Platform	1287
8.9.13. Next steps	1287
8.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES	1287
8.10.1. Prerequisites	1287
8.10.2. Certificate signing requests management	1288
8.10.3. Internet access for OpenShift Container Platform	1288
8.10.4. Configuring your GCP project	1288
8.10.4.1. Creating a GCP project	1288
8.10.4.2. Enabling API services in GCP	1289
8.10.4.3. Configuring DNS for GCP	1290
8.10.4.4. GCP account limits	1290
8.10.4.5. Creating a service account in GCP	1292
8.10.4.6. Required GCP roles	1292
8.10.4.7. Required GCP permissions for user-provisioned infrastructure	1293
8.10.4.8. Supported GCP regions	1301
8.10.4.9. Installing and configuring CLI tools for GCP	1302
8.10.5. Requirements for a cluster with user-provisioned infrastructure	1302
8.10.5.1. Required machines for cluster installation	1302
8.10.5.2. Minimum resource requirements for cluster installation	1303
8.10.5.3. Tested instance types for GCP	1304
8.10.5.4. Using custom machine types	1304
8.10.6. Creating the installation files for GCP	1304

8.10.6.1. Optional: Creating a separate /var partition	1305
8.10.6.2. Creating the installation configuration file	1307
8.10.6.3. Configuring the cluster-wide proxy during installation	1309
8.10.6.4. Creating the Kubernetes manifest and Ignition config files	1310
8.10.7. Exporting common variables	1312
8.10.7.1. Extracting the infrastructure name	1312
8.10.7.2. Exporting common variables for Deployment Manager templates	1313
8.10.8. Creating a VPC in GCP	1314
8.10.8.1. Deployment Manager template for the VPC	1315
8.10.9. Networking requirements for user-provisioned infrastructure	1316
8.10.9.1. Setting the cluster node hostnames through DHCP	1316
8.10.9.2. Network connectivity requirements	1316
8.10.10. Creating load balancers in GCP	1318
8.10.10.1. Deployment Manager template for the external load balancer	1319
8.10.10.2. Deployment Manager template for the internal load balancer	1320
8.10.11. Creating a private DNS zone in GCP	1322
8.10.11.1. Deployment Manager template for the private DNS	1323
8.10.12. Creating firewall rules in GCP	1324
8.10.12.1. Deployment Manager template for firewall rules	1325
8.10.13. Creating IAM roles in GCP	1327
8.10.13.1. Deployment Manager template for IAM roles	1329
8.10.14. Creating the RHCOS cluster image for the GCP infrastructure	1329
8.10.15. Creating the bootstrap machine in GCP	1330
8.10.15.1. Deployment Manager template for the bootstrap machine	1332
8.10.16. Creating the control plane machines in GCP	1334
8.10.16.1. Deployment Manager template for control plane machines	1336
8.10.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1338
8.10.18. Creating additional worker machines in GCP	1339
8.10.18.1. Deployment Manager template for worker machines	1341
8.10.19. Installing the OpenShift CLI by downloading the binary	1342
Installing the OpenShift CLI on Linux	1342
Installing the OpenShift CLI on Windows	1342
Installing the OpenShift CLI on macOS	1343
8.10.20. Logging in to the cluster by using the CLI	1343
8.10.21. Approving the certificate signing requests for your machines	1344
8.10.22. Optional: Adding the ingress DNS records	1347
8.10.23. Completing a GCP installation on user-provisioned infrastructure	1348
8.10.24. Telemetry access for OpenShift Container Platform	1351
8.10.25. Next steps	1351
8.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES	1351
8.11.1. Prerequisites	1351
8.11.2. Certificate signing requests management	1352
8.11.3. Internet access for OpenShift Container Platform	1352
8.11.4. Configuring the GCP project that hosts your cluster	1352
8.11.4.1. Creating a GCP project	1352
8.11.4.2. Enabling API services in GCP	1353
8.11.4.3. GCP account limits	1354
8.11.4.4. Creating a service account in GCP	1355
8.11.4.4.1. Required GCP roles	1356
8.11.4.5. Supported GCP regions	1357
8.11.4.6. Installing and configuring CLI tools for GCP	1358
8.11.5. Requirements for a cluster with user-provisioned infrastructure	1358

---

8.11.5.1. Required machines for cluster installation	1359
8.11.5.2. Minimum resource requirements for cluster installation	1359
8.11.5.3. Tested instance types for GCP	1360
8.11.5.4. Using custom machine types	1360
8.11.6. Configuring the GCP project that hosts your shared VPC network	1361
8.11.6.1. Configuring DNS for GCP	1361
8.11.6.2. Creating a VPC in GCP	1362
8.11.6.2.1. Deployment Manager template for the VPC	1364
8.11.7. Creating the installation files for GCP	1365
8.11.7.1. Manually creating the installation configuration file	1365
8.11.7.2. Sample customized install-config.yaml file for GCP	1366
8.11.7.3. Configuring the cluster-wide proxy during installation	1368
8.11.7.4. Creating the Kubernetes manifest and Ignition config files	1370
8.11.8. Exporting common variables	1372
8.11.8.1. Extracting the infrastructure name	1372
8.11.8.2. Exporting common variables for Deployment Manager templates	1373
8.11.9. Networking requirements for user-provisioned infrastructure	1374
8.11.9.1. Setting the cluster node hostnames through DHCP	1374
8.11.9.2. Network connectivity requirements	1374
8.11.10. Creating load balancers in GCP	1375
8.11.10.1. Deployment Manager template for the external load balancer	1377
8.11.10.2. Deployment Manager template for the internal load balancer	1378
8.11.11. Creating a private DNS zone in GCP	1380
8.11.11.1. Deployment Manager template for the private DNS	1381
8.11.12. Creating firewall rules in GCP	1382
8.11.12.1. Deployment Manager template for firewall rules	1383
8.11.13. Creating IAM roles in GCP	1385
8.11.13.1. Deployment Manager template for IAM roles	1388
8.11.14. Creating the RHCOS cluster image for the GCP infrastructure	1388
8.11.15. Creating the bootstrap machine in GCP	1389
8.11.15.1. Deployment Manager template for the bootstrap machine	1391
8.11.16. Creating the control plane machines in GCP	1392
8.11.16.1. Deployment Manager template for control plane machines	1394
8.11.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1396
8.11.18. Creating additional worker machines in GCP	1397
8.11.18.1. Deployment Manager template for worker machines	1400
8.11.19. Installing the OpenShift CLI by downloading the binary	1401
Installing the OpenShift CLI on Linux	1401
Installing the OpenShift CLI on Windows	1401
Installing the OpenShift CLI on macOS	1402
8.11.20. Logging in to the cluster by using the CLI	1402
8.11.21. Approving the certificate signing requests for your machines	1403
8.11.22. Adding the ingress DNS records	1405
8.11.23. Adding ingress firewall rules	1407
8.11.23.1. Creating cluster-wide firewall rules for a shared VPC in GCP	1407
8.11.24. Completing a GCP installation on user-provisioned infrastructure	1408
8.11.25. Telemetry access for OpenShift Container Platform	1411
8.11.26. Next steps	1411
8.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	1411
8.12.1. Prerequisites	1412
8.12.2. About installations in restricted networks	1412
8.12.2.1. Additional limits	1413

---

8.12.3. Internet access for OpenShift Container Platform	1413
8.12.4. Configuring your GCP project	1413
8.12.4.1. Creating a GCP project	1413
8.12.4.2. Enabling API services in GCP	1414
8.12.4.3. Configuring DNS for GCP	1415
8.12.4.4. GCP account limits	1415
8.12.4.5. Creating a service account in GCP	1417
8.12.4.6. Required GCP roles	1417
8.12.4.7. Required GCP permissions for user-provisioned infrastructure	1418
8.12.4.8. Supported GCP regions	1425
8.12.4.9. Installing and configuring CLI tools for GCP	1427
8.12.5. Requirements for a cluster with user-provisioned infrastructure	1427
8.12.5.1. Required machines for cluster installation	1427
8.12.5.2. Minimum resource requirements for cluster installation	1428
8.12.5.3. Tested instance types for GCP	1429
8.12.5.4. Using custom machine types	1429
8.12.6. Creating the installation files for GCP	1429
8.12.6.1. Optional: Creating a separate /var partition	1430
8.12.6.2. Creating the installation configuration file	1432
8.12.6.3. Configuring the cluster-wide proxy during installation	1434
8.12.6.4. Creating the Kubernetes manifest and Ignition config files	1436
8.12.7. Exporting common variables	1438
8.12.7.1. Extracting the infrastructure name	1438
8.12.7.2. Exporting common variables for Deployment Manager templates	1439
8.12.8. Creating a VPC in GCP	1439
8.12.8.1. Deployment Manager template for the VPC	1440
8.12.9. Networking requirements for user-provisioned infrastructure	1442
8.12.9.1. Setting the cluster node hostnames through DHCP	1442
8.12.9.2. Network connectivity requirements	1442
8.12.10. Creating load balancers in GCP	1443
8.12.10.1. Deployment Manager template for the external load balancer	1445
8.12.10.2. Deployment Manager template for the internal load balancer	1446
8.12.11. Creating a private DNS zone in GCP	1447
8.12.11.1. Deployment Manager template for the private DNS	1449
8.12.12. Creating firewall rules in GCP	1449
8.12.12.1. Deployment Manager template for firewall rules	1450
8.12.13. Creating IAM roles in GCP	1453
8.12.13.1. Deployment Manager template for IAM roles	1454
8.12.14. Creating the RHCOS cluster image for the GCP infrastructure	1455
8.12.15. Creating the bootstrap machine in GCP	1456
8.12.15.1. Deployment Manager template for the bootstrap machine	1458
8.12.16. Creating the control plane machines in GCP	1459
8.12.16.1. Deployment Manager template for control plane machines	1461
8.12.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1463
8.12.18. Creating additional worker machines in GCP	1464
8.12.18.1. Deployment Manager template for worker machines	1466
8.12.19. Logging in to the cluster by using the CLI	1467
8.12.20. Disabling the default OperatorHub sources	1468
8.12.21. Approving the certificate signing requests for your machines	1468
8.12.22. Optional: Adding the ingress DNS records	1471
8.12.23. Completing a GCP installation on user-provisioned infrastructure	1472
8.12.24. Telemetry access for OpenShift Container Platform	1475
8.12.25. Next steps	1475

8.13. UNINSTALLING A CLUSTER ON GCP	1475
8.13.1. Removing a cluster that uses installer-provisioned infrastructure	1475
8.13.2. Deleting GCP resources with the Cloud Credential Operator utility	1476
<b>CHAPTER 9. INSTALLING ON IBM CLOUD VPC</b> .....	<b>1478</b>
9.1. PREPARING TO INSTALL ON IBM CLOUD VPC	1478
9.1.1. Prerequisites	1478
9.1.2. Requirements for installing OpenShift Container Platform on IBM Cloud VPC	1478
9.1.3. Choosing a method to install OpenShift Container Platform on IBM Cloud VPC	1478
9.1.3.1. Installing a cluster on installer-provisioned infrastructure	1478
9.1.4. Next steps	1479
9.2. CONFIGURING AN IBM CLOUD ACCOUNT	1479
9.2.1. Prerequisites	1479
9.2.2. Quotas and limits on IBM Cloud VPC	1479
Virtual Private Cloud (VPC)	1479
Application load balancer	1479
Floating IP address	1480
Virtual Server Instances (VSI)	1480
Block Storage Volumes	1481
9.2.3. Configuring DNS resolution using Cloud Internet Services	1481
9.2.4. IBM Cloud VPC IAM Policies and API Key	1482
9.2.4.1. Required access policies	1482
9.2.4.2. Access policy assignment	1483
9.2.4.3. Creating an API key	1483
9.2.5. Supported IBM Cloud VPC regions	1484
9.2.6. Next steps	1484
9.3. CONFIGURING IAM FOR IBM CLOUD VPC	1484
9.3.1. Alternatives to storing administrator-level secrets in the kube-system project	1485
9.3.2. Configuring the Cloud Credential Operator utility	1485
9.3.3. Next steps	1486
9.3.4. Additional resources	1486
9.4. INSTALLING A CLUSTER ON IBM CLOUD VPC WITH CUSTOMIZATIONS	1486
9.4.1. Prerequisites	1487
9.4.2. Internet access for OpenShift Container Platform	1487
9.4.3. Generating a key pair for cluster node SSH access	1487
9.4.4. Obtaining the installation program	1489
9.4.5. Exporting the IBM Cloud VPC API key	1490
9.4.6. Creating the installation configuration file	1490
9.4.6.1. Installation configuration parameters	1492
9.4.6.1.1. Required configuration parameters	1492
9.4.6.1.2. Network configuration parameters	1493
9.4.6.1.3. Optional configuration parameters	1495
9.4.6.1.4. Additional IBM Cloud VPC configuration parameters	1500
9.4.6.2. Sample customized install-config.yaml file for IBM Cloud VPC	1501
9.4.6.3. Configuring the cluster-wide proxy during installation	1503
9.4.7. Manually creating IAM for IBM Cloud VPC	1504
9.4.8. Deploying the cluster	1507
9.4.9. Installing the OpenShift CLI by downloading the binary	1508
Installing the OpenShift CLI on Linux	1508
Installing the OpenShift CLI on Windows	1509
Installing the OpenShift CLI on macOS	1509
9.4.10. Logging in to the cluster by using the CLI	1510
9.4.11. Telemetry access for OpenShift Container Platform	1510

9.4.12. Next steps	1510
9.5. INSTALLING A CLUSTER ON IBM CLOUD VPC WITH NETWORK CUSTOMIZATIONS	1511
9.5.1. Prerequisites	1511
9.5.2. Internet access for OpenShift Container Platform	1511
9.5.3. Generating a key pair for cluster node SSH access	1512
9.5.4. Obtaining the installation program	1514
9.5.5. Exporting the IBM Cloud VPC API key	1514
9.5.6. Creating the installation configuration file	1515
9.5.6.1. Installation configuration parameters	1516
9.5.6.1.1. Required configuration parameters	1516
9.5.6.1.2. Network configuration parameters	1518
9.5.6.1.3. Optional configuration parameters	1520
9.5.6.1.4. Additional IBM Cloud VPC configuration parameters	1524
9.5.6.2. Sample customized install-config.yaml file for IBM Cloud VPC	1525
9.5.6.3. Configuring the cluster-wide proxy during installation	1527
9.5.7. Manually creating IAM for IBM Cloud VPC	1529
9.5.8. Network configuration phases	1531
9.5.9. Specifying advanced network configuration	1532
9.5.10. Cluster Network Operator configuration	1533
9.5.10.1. Cluster Network Operator configuration object	1533
defaultNetwork object configuration	1534
Configuration for the OpenShift SDN CNI cluster network provider	1535
Configuration for the OVN-Kubernetes CNI cluster network provider	1536
kubeProxyConfig object configuration	1538
9.5.11. Deploying the cluster	1539
9.5.12. Installing the OpenShift CLI by downloading the binary	1541
Installing the OpenShift CLI on Linux	1541
Installing the OpenShift CLI on Windows	1541
Installing the OpenShift CLI on macOS	1542
9.5.13. Logging in to the cluster by using the CLI	1542
9.5.14. Telemetry access for OpenShift Container Platform	1543
9.5.15. Next steps	1543
9.6. UNINSTALLING A CLUSTER ON IBM CLOUD VPC	1543
9.6.1. Removing a cluster that uses installer-provisioned infrastructure	1543
<b>CHAPTER 10. INSTALLING ON BARE METAL</b>	<b>1546</b>
10.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION	1546
10.1.1. Prerequisites	1546
10.1.2. Planning a bare metal cluster for OpenShift Virtualization	1546
10.1.3. Choosing a method to install OpenShift Container Platform on bare metal	1546
10.1.3.1. Installing a cluster on installer-provisioned infrastructure	1547
10.1.3.2. Installing a cluster on user-provisioned infrastructure	1547
10.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL	1547
10.2.1. Prerequisites	1547
10.2.2. Internet access for OpenShift Container Platform	1548
10.2.3. Requirements for a cluster with user-provisioned infrastructure	1548
10.2.3.1. Required machines for cluster installation	1548
10.2.3.2. Minimum resource requirements for cluster installation	1549
10.2.3.3. Certificate signing requests management	1550
10.2.3.4. Networking requirements for user-provisioned infrastructure	1550
10.2.3.4.1. Setting the cluster node hostnames through DHCP	1551
10.2.3.4.2. Network connectivity requirements	1551
NTP configuration for user-provisioned infrastructure	1552

10.2.3.5. User-provisioned DNS requirements	1552
10.2.3.5.1. Example DNS configuration for user-provisioned clusters	1554
10.2.3.6. Load balancing requirements for user-provisioned infrastructure	1556
10.2.3.6.1. Example load balancer configuration for user-provisioned clusters	1558
10.2.4. Preparing the user-provisioned infrastructure	1560
10.2.5. Validating DNS resolution for user-provisioned infrastructure	1562
10.2.6. Generating a key pair for cluster node SSH access	1564
10.2.7. Obtaining the installation program	1566
10.2.8. Installing the OpenShift CLI by downloading the binary	1567
Installing the OpenShift CLI on Linux	1567
Installing the OpenShift CLI on Windows	1568
Installing the OpenShift CLI on macOS	1568
10.2.9. Manually creating the installation configuration file	1569
10.2.9.1. Installation configuration parameters	1570
10.2.9.1.1. Required configuration parameters	1570
10.2.9.1.2. Network configuration parameters	1571
10.2.9.1.3. Optional configuration parameters	1573
10.2.9.2. Sample install-config.yaml file for bare metal	1578
10.2.9.3. Configuring the cluster-wide proxy during installation	1581
10.2.9.4. Configuring a three-node cluster	1582
10.2.10. Creating the Kubernetes manifest and Ignition config files	1583
10.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1585
10.2.11.1. Installing RHCOS by using an ISO image	1586
10.2.11.2. Installing RHCOS by using PXE or iPXE booting	1589
10.2.11.3. Advanced RHCOS installation configuration	1594
10.2.11.3.1. Using advanced networking options for PXE and ISO installations	1594
10.2.11.3.2. Disk partitioning	1595
10.2.11.3.2.1. Creating a separate /var partition	1596
10.2.11.3.2.2. Retaining existing partitions	1598
10.2.11.3.3. Identifying Ignition configs	1599
10.2.11.3.3.1. Customizing a live RHCOS ISO or PXE install	1600
10.2.11.3.3.2. Customizing a live RHCOS ISO image	1600
10.2.11.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority	1601
10.2.11.3.3.2.2. Modifying a live install ISO image with customized network settings	1601
10.2.11.3.3.3. Customizing a live RHCOS PXE environment	1603
10.2.11.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority	1603
10.2.11.3.3.3.2. Modifying a live install PXE environment with customized network settings	1604
10.2.11.3.4. Advanced RHCOS installation reference	1605
10.2.11.3.4.1. Networking and bonding options for ISO installations	1605
Configuring DHCP or static IP addresses	1606
Configuring an IP address without a static hostname	1606
Specifying multiple network interfaces	1606
Configuring default gateway and route	1607
Disabling DHCP on a single interface	1607
Combining DHCP and static IP configurations	1607
Configuring VLANs on individual interfaces	1607
Providing multiple DNS servers	1607
Bonding multiple network interfaces to a single interface	1608
Bonding multiple network interfaces to a single interface	1608
Using network teaming	1608
10.2.11.3.4.2. coreos-installer options for ISO and PXE installations	1609
10.2.11.3.4.3. coreos.inst boot options for ISO or PXE installations	1613
10.2.11.4. Enabling multipathing with kernel arguments on RHCOS	1614

10.2.11.5. Updating the bootloader using bootupd	1616
10.2.12. Waiting for the bootstrap process to complete	1618
10.2.13. Logging in to the cluster by using the CLI	1619
10.2.14. Approving the certificate signing requests for your machines	1619
10.2.15. Initial Operator configuration	1622
10.2.15.1. Image registry removed during installation	1623
10.2.15.2. Image registry storage configuration	1623
10.2.15.2.1. Configuring registry storage for bare metal and other manual installations	1624
10.2.15.2.2. Configuring storage for the image registry in non-production clusters	1625
10.2.15.2.3. Configuring block registry storage	1626
10.2.16. Completing installation on user-provisioned infrastructure	1626
10.2.17. Telemetry access for OpenShift Container Platform	1629
10.2.18. Next steps	1629
10.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS	1629
10.3.1. Prerequisites	1629
10.3.2. Internet access for OpenShift Container Platform	1629
10.3.3. Requirements for a cluster with user-provisioned infrastructure	1630
10.3.3.1. Required machines for cluster installation	1630
10.3.3.2. Minimum resource requirements for cluster installation	1631
10.3.3.3. Certificate signing requests management	1632
10.3.3.4. Networking requirements for user-provisioned infrastructure	1632
10.3.3.4.1. Setting the cluster node hostnames through DHCP	1632
10.3.3.4.2. Network connectivity requirements	1633
NTP configuration for user-provisioned infrastructure	1634
10.3.3.5. User-provisioned DNS requirements	1634
10.3.3.5.1. Example DNS configuration for user-provisioned clusters	1636
10.3.3.6. Load balancing requirements for user-provisioned infrastructure	1638
10.3.3.6.1. Example load balancer configuration for user-provisioned clusters	1640
10.3.4. Preparing the user-provisioned infrastructure	1642
10.3.5. Validating DNS resolution for user-provisioned infrastructure	1644
10.3.6. Generating a key pair for cluster node SSH access	1646
10.3.7. Obtaining the installation program	1648
10.3.8. Installing the OpenShift CLI by downloading the binary	1649
Installing the OpenShift CLI on Linux	1649
Installing the OpenShift CLI on Windows	1649
Installing the OpenShift CLI on macOS	1650
10.3.9. Manually creating the installation configuration file	1650
10.3.9.1. Installation configuration parameters	1651
10.3.9.1.1. Required configuration parameters	1651
10.3.9.1.2. Network configuration parameters	1653
10.3.9.1.3. Optional configuration parameters	1655
10.3.9.2. Sample install-config.yaml file for bare metal	1659
10.3.10. Network configuration phases	1662
10.3.11. Specifying advanced network configuration	1663
10.3.12. Cluster Network Operator configuration	1664
10.3.12.1. Cluster Network Operator configuration object	1664
defaultNetwork object configuration	1665
Configuration for the OpenShift SDN CNI cluster network provider	1666
Configuration for the OVN-Kubernetes CNI cluster network provider	1667
kubeProxyConfig object configuration	1669
10.3.13. Creating the Ignition config files	1670
10.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1671
10.3.14.1. Installing RHCOS by using an ISO image	1672

---

10.3.14.2. Installing RHCOS by using PXE or iPXE booting	1675
10.3.14.3. Advanced RHCOS installation configuration	1680
10.3.14.3.1. Using advanced networking options for PXE and ISO installations	1680
10.3.14.3.2. Disk partitioning	1681
10.3.14.3.2.1. Creating a separate /var partition	1682
10.3.14.3.2.2. Retaining existing partitions	1684
10.3.14.3.3. Identifying Ignition configs	1685
10.3.14.3.3.1. Customizing a live RHCOS ISO or PXE install	1686
10.3.14.3.3.2. Customizing a live RHCOS ISO image	1686
10.3.14.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority	1687
10.3.14.3.3.2.2. Modifying a live install ISO image with customized network settings	1687
10.3.14.3.3.3. Customizing a live RHCOS PXE environment	1689
10.3.14.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority	1689
10.3.14.3.3.3.2. Modifying a live install PXE environment with customized network settings	1690
10.3.14.3.4. Advanced RHCOS installation reference	1691
10.3.14.3.4.1. Networking and bonding options for ISO installations	1691
Configuring DHCP or static IP addresses	1692
Configuring an IP address without a static hostname	1692
Specifying multiple network interfaces	1692
Configuring default gateway and route	1693
Disabling DHCP on a single interface	1693
Combining DHCP and static IP configurations	1693
Configuring VLANs on individual interfaces	1693
Providing multiple DNS servers	1693
Bonding multiple network interfaces to a single interface	1694
Bonding multiple network interfaces to a single interface	1694
Using network teaming	1694
10.3.14.3.4.2. coreos-installer options for ISO and PXE installations	1695
10.3.14.3.4.3. coreos.inst boot options for ISO or PXE installations	1699
10.3.14.4. Enabling multipathing with kernel arguments on RHCOS	1700
10.3.14.5. Updating the bootloader using bootupd	1702
10.3.15. Waiting for the bootstrap process to complete	1704
10.3.16. Logging in to the cluster by using the CLI	1705
10.3.17. Approving the certificate signing requests for your machines	1705
10.3.18. Initial Operator configuration	1708
10.3.18.1. Image registry removed during installation	1709
10.3.18.2. Image registry storage configuration	1709
10.3.18.3. Configuring block registry storage	1709
10.3.19. Completing installation on user-provisioned infrastructure	1710
10.3.20. Telemetry access for OpenShift Container Platform	1712
10.3.21. Next steps	1712
10.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK	1713
10.4.1. Prerequisites	1713
10.4.2. About installations in restricted networks	1713
10.4.2.1. Additional limits	1714
10.4.3. Internet access for OpenShift Container Platform	1714
10.4.4. Requirements for a cluster with user-provisioned infrastructure	1714
10.4.4.1. Required machines for cluster installation	1715
10.4.4.2. Minimum resource requirements for cluster installation	1715
10.4.4.3. Certificate signing requests management	1716
10.4.4.4. Networking requirements for user-provisioned infrastructure	1716
10.4.4.4.1. Setting the cluster node hostnames through DHCP	1717
10.4.4.4.2. Network connectivity requirements	1717

---

NTP configuration for user-provisioned infrastructure	1718
10.4.4.5. User-provisioned DNS requirements	1719
10.4.4.5.1. Example DNS configuration for user-provisioned clusters	1721
10.4.4.6. Load balancing requirements for user-provisioned infrastructure	1723
10.4.4.6.1. Example load balancer configuration for user-provisioned clusters	1725
10.4.5. Preparing the user-provisioned infrastructure	1727
10.4.6. Validating DNS resolution for user-provisioned infrastructure	1729
10.4.7. Generating a key pair for cluster node SSH access	1731
10.4.8. Manually creating the installation configuration file	1733
10.4.8.1. Installation configuration parameters	1734
10.4.8.1.1. Required configuration parameters	1734
10.4.8.1.2. Network configuration parameters	1736
10.4.8.1.3. Optional configuration parameters	1738
10.4.8.2. Sample install-config.yaml file for bare metal	1742
10.4.8.3. Configuring the cluster-wide proxy during installation	1745
10.4.8.4. Configuring a three-node cluster	1747
10.4.9. Creating the Kubernetes manifest and Ignition config files	1748
10.4.10. Configuring chrony time service	1750
10.4.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1751
10.4.11.1. Installing RHCOS by using an ISO image	1752
10.4.11.2. Installing RHCOS by using PXE or iPXE booting	1755
10.4.11.3. Advanced RHCOS installation configuration	1760
10.4.11.3.1. Using advanced networking options for PXE and ISO installations	1760
10.4.11.3.2. Disk partitioning	1761
10.4.11.3.2.1. Creating a separate /var partition	1762
10.4.11.3.2.2. Retaining existing partitions	1764
10.4.11.3.3. Identifying Ignition configs	1765
10.4.11.3.3.1. Customizing a live RHCOS ISO or PXE install	1765
10.4.11.3.3.2. Customizing a live RHCOS ISO image	1766
10.4.11.3.3.2.1. Modifying a live install ISO image to use a custom certificate authority	1766
10.4.11.3.3.2.2. Modifying a live install ISO image with customized network settings	1767
10.4.11.3.3.3. Customizing a live RHCOS PXE environment	1768
10.4.11.3.3.3.1. Modifying a live install PXE environment to use a custom certificate authority	1769
10.4.11.3.3.3.2. Modifying a live install PXE environment with customized network settings	1769
10.4.11.3.4. Advanced RHCOS installation reference	1771
10.4.11.3.4.1. Networking and bonding options for ISO installations	1771
Configuring DHCP or static IP addresses	1771
Configuring an IP address without a static hostname	1772
Specifying multiple network interfaces	1772
Configuring default gateway and route	1772
Disabling DHCP on a single interface	1773
Combining DHCP and static IP configurations	1773
Configuring VLANs on individual interfaces	1773
Providing multiple DNS servers	1773
Bonding multiple network interfaces to a single interface	1773
Bonding multiple network interfaces to a single interface	1774
Using network teaming	1774
10.4.11.3.4.2. coreos-installer options for ISO and PXE installations	1774
10.4.11.3.4.3. coreos.inst boot options for ISO or PXE installations	1778
10.4.11.4. Enabling multipathing with kernel arguments on RHCOS	1780
10.4.11.5. Updating the bootloader using bootupd	1782
10.4.12. Waiting for the bootstrap process to complete	1783
10.4.13. Logging in to the cluster by using the CLI	1784

10.4.14. Approving the certificate signing requests for your machines	1785
10.4.15. Initial Operator configuration	1787
10.4.15.1. Disabling the default OperatorHub sources	1788
10.4.15.2. Image registry storage configuration	1789
10.4.15.2.1. Changing the image registry's management state	1789
10.4.15.2.2. Configuring registry storage for bare metal and other manual installations	1789
10.4.15.2.3. Configuring storage for the image registry in non-production clusters	1791
10.4.15.2.4. Configuring block registry storage	1791
10.4.16. Completing installation on user-provisioned infrastructure	1792
10.4.17. Telemetry access for OpenShift Container Platform	1794
10.4.18. Next steps	1795
<b>CHAPTER 11. INSTALLING ON-PREMISE WITH ASSISTED INSTALLER</b> .....	<b>1796</b>
11.1. INSTALLING AN ON-PREMISE CLUSTER USING THE ASSISTED INSTALLER	1796
11.1.1. Using the Assisted Installer	1796
11.1.2. API support for the Assisted Installer	1797
11.2. PREPARING TO INSTALL WITH THE ASSISTED INSTALLER	1797
11.2.1. Prerequisites	1797
11.2.2. Assisted Installer prerequisites	1797
11.2.2.1. Hardware	1797
11.2.2.2. Networking	1798
11.2.2.3. Preflight validations	1798
11.2.3. Additional resources	1799
11.3. INSTALLING WITH THE ASSISTED INSTALLER	1799
11.3.1. Pre-installation considerations	1799
11.3.2. Setting the cluster details	1799
11.3.3. Optional: Configuring host network interfaces	1800
11.3.4. Adding hosts to the cluster	1801
11.3.5. Creating an ISO image on a USB drive	1802
11.3.6. Booting with a USB drive	1802
11.3.7. Booting from an HTTP-hosted ISO image using the Redfish API	1802
11.3.8. Configuring hosts	1803
11.3.9. Configuring networking	1804
11.3.10. Installing the cluster	1805
11.3.11. Completing the installation	1805
11.3.12. Additional resources	1806
<b>CHAPTER 12. INSTALLING ON A SINGLE NODE</b> .....	<b>1807</b>
12.1. PREPARING TO INSTALL ON A SINGLE NODE	1807
12.1.1. Prerequisites	1807
12.1.2. About OpenShift on a single node	1807
12.1.3. Requirements for installing OpenShift on a single node	1807
12.2. INSTALLING OPENSIFT ON A SINGLE NODE	1808
12.2.1. Generating the discovery ISO with the Assisted Installer	1808
12.2.2. Generating the discovery ISO manually	1809
12.2.3. Installing with USB media	1811
12.2.4. Monitoring the installation with the Assisted Installer	1812
12.2.5. Monitoring the installation manually	1812
<b>CHAPTER 13. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL</b> .....	<b>1814</b>
13.1. OVERVIEW	1814
13.2. PREREQUISITES	1815
13.2.1. Node requirements	1816
13.2.2. Planning a bare metal cluster for OpenShift Virtualization	1817

13.2.3. Firmware requirements for installing with virtual media	1818
13.2.4. Network requirements	1818
13.2.4.1. Increase the network MTU	1819
13.2.4.2. Configuring NICs	1819
13.2.4.3. DNS requirements	1820
13.2.4.4. Dynamic Host Configuration Protocol (DHCP) requirements	1821
13.2.4.5. Reserving IP addresses for nodes with the DHCP server	1821
13.2.4.6. Network Time Protocol (NTP)	1822
13.2.4.7. Port access for the out-of-band management IP address	1822
13.2.5. Configuring nodes	1823
Configuring nodes when using the provisioning network	1823
Configuring nodes without the provisioning network	1824
Configuring nodes for Secure Boot manually	1824
Configuring the Compatibility Support Module for Fujitsu iRMC	1824
13.2.6. Out-of-band management	1825
13.2.7. Required data for installation	1825
13.2.8. Validation checklist for nodes	1826
13.3. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT INSTALLATION	1827
13.3.1. Installing RHEL on the provisioner node	1827
13.3.2. Preparing the provisioner node for OpenShift Container Platform installation	1827
13.3.3. Establishing communication between subnets	1829
13.3.4. Retrieving the OpenShift Container Platform installer	1832
13.3.5. Extracting the OpenShift Container Platform installer	1832
13.3.6. (Optional) Creating an RHCOS images cache	1833
13.3.7. Configuring the install-config.yaml file	1835
13.3.7.1. Configuring the install-config.yaml file	1835
13.3.7.2. Additional install-config parameters	1837
Hosts	1841
13.3.7.3. BMC addressing	1842
IPMI	1842
Redfish network boot	1843
13.3.7.4. BMC addressing for Dell iDRAC	1843
BMC address formats for Dell iDRAC	1844
Redfish virtual media for Dell iDRAC	1844
Redfish network boot for iDRAC	1845
13.3.7.5. BMC addressing for HPE iLO	1846
Redfish virtual media for HPE iLO	1846
Redfish network boot for HPE iLO	1847
13.3.7.6. BMC addressing for Fujitsu iRMC	1848
13.3.7.7. Root device hints	1849
13.3.7.8. (Optional) Setting proxy settings	1850
13.3.7.9. (Optional) Deploying with no provisioning network	1850
13.3.7.10. (Optional) Deploying with dual-stack networking	1851
13.3.7.11. (Optional) Configuring host network interfaces	1851
13.3.7.12. Configuring host network interfaces for subnets	1853
13.3.7.13. Configuring multiple cluster nodes	1855
13.3.7.14. (Optional) Configuring managed Secure Boot	1855
13.3.8. Manifest configuration files	1856
13.3.8.1. Creating the OpenShift Container Platform manifests	1856
13.3.8.2. (Optional) Configuring NTP for disconnected clusters	1856
13.3.8.3. (Optional) Configuring network components to run on the control plane	1859
13.3.8.4. (Optional) Deploying routers on worker nodes	1861
13.3.8.5. (Optional) Configuring the BIOS for worker nodes	1862

13.3.8.6. (Optional) Configuring RAID for worker nodes	1862
13.3.9. Creating a disconnected registry	1864
Prerequisites	1864
13.3.9.1. Preparing the registry node to host the mirrored registry	1864
13.3.9.2. Mirroring the OpenShift Container Platform image repository for a disconnected registry	1864
13.3.9.3. Modify the install-config.yaml file to use the disconnected registry	1868
13.3.10. Assigning a static IP address to the bootstrap VM	1868
13.3.11. Validation checklist for installation	1869
13.3.12. Deploying the cluster via the OpenShift Container Platform installer	1870
13.3.13. Following the installation	1870
13.3.14. Verifying static IP address configuration	1870
13.3.15. Additional resources	1870
13.4. INSTALLER-PROVISIONED POST-INSTALLATION CONFIGURATION	1870
13.4.1. (Optional) Configuring NTP for disconnected clusters	1871
13.4.2. Enabling a provisioning network after installation	1873
13.4.3. Configuring an external load balancer	1875
13.4.4. Manual migration to new customDeploy install method	1877
13.4.5. Additional resources	1878
13.5. EXPANDING THE CLUSTER	1878
13.5.1. Preparing the bare metal node	1878
13.5.2. Replacing a bare-metal control plane node	1883
13.5.3. Preparing to deploy with Virtual Media on the baremetal network	1886
13.5.4. Diagnosing a duplicate MAC address when provisioning a new host in the cluster	1888
13.5.5. Provisioning the bare metal node	1889
13.6. TROUBLESHOOTING	1891
13.6.1. Troubleshooting the installer workflow	1891
13.6.2. Troubleshooting install-config.yaml	1893
13.6.3. Bootstrap VM issues	1894
13.6.3.1. Bootstrap VM cannot boot up the cluster nodes	1895
13.6.3.2. Inspecting logs	1896
13.6.4. Cluster nodes will not PXE boot	1897
13.6.5. The API is not accessible	1897
13.6.6. Troubleshooting worker nodes that cannot join the cluster	1898
13.6.7. Cleaning up previous installations	1899
13.6.8. Issues with creating the registry	1899
13.6.9. Miscellaneous issues	1900
13.6.9.1. Addressing the runtime network not ready error	1900
13.6.9.2. Cluster nodes not getting the correct IPv6 address over DHCP	1901
13.6.9.3. Cluster nodes not getting the correct hostname over DHCP	1902
13.6.9.4. Routes do not reach endpoints	1903
13.6.9.5. Failed Ignition during Firstboot	1904
13.6.9.6. NTP out of sync	1904
13.6.10. Reviewing the installation	1906
<b>CHAPTER 14. INSTALLING IBM CLOUD BARE METAL (CLASSIC) .....</b>	<b>1908</b>
14.1. PREREQUISITES	1908
14.1.1. Setting up IBM Cloud Bare Metal (Classic) infrastructure	1908
Use one data center per cluster	1908
Create public and private VLANs	1908
Ensure subnets have sufficient IP addresses	1908
Configuring NICs	1909
Configuring canonical names	1910
Creating DNS entries	1910

Network Time Protocol (NTP)	1911
Configure a DHCP server	1911
Ensure BMC access privileges	1911
Create bare metal servers	1912
14.2. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT CONTAINER PLATFORM INSTALLATION	1912
14.2.1. Preparing the provisioner node on IBM Cloud Bare Metal (Classic) infrastructure	1912
14.2.2. Configuring the public subnet	1916
14.2.3. Retrieving the OpenShift Container Platform installer	1918
14.2.4. Extracting the OpenShift Container Platform installer	1918
14.2.5. Configuring the install-config.yaml file	1919
14.2.6. Additional install-config parameters	1921
Hosts	1925
14.2.7. Root device hints	1926
14.2.8. Creating the OpenShift Container Platform manifests	1927
14.2.9. Deploying the cluster via the OpenShift Container Platform installer	1927
14.2.10. Following the installation	1927
<b>CHAPTER 15. INSTALLING WITH Z/VM ON IBM Z AND LINUXONE</b>	<b>1929</b>
15.1. PREPARING TO INSTALL WITH Z/VM ON IBM Z AND LINUXONE	1929
15.1.1. Prerequisites	1929
15.1.2. Choosing a method to install OpenShift Container Platform with z/VM on IBM Z or LinuxONE	1929
15.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE	1929
15.2.1. Prerequisites	1929
15.2.2. Internet access for OpenShift Container Platform	1930
15.2.3. Requirements for a cluster with user-provisioned infrastructure	1930
15.2.3.1. Required machines for cluster installation	1930
15.2.3.2. Minimum resource requirements for cluster installation	1931
15.2.3.3. Minimum IBM Z system environment	1931
Hardware requirements	1932
Operating system requirements	1932
IBM Z network connectivity requirements	1932
Disk storage for the z/VM guest virtual machines	1932
Storage / Main Memory	1932
15.2.3.4. Preferred IBM Z system environment	1933
Hardware requirements	1933
Operating system requirements	1933
IBM Z network connectivity requirements	1933
Disk storage for the z/VM guest virtual machines	1933
Storage / Main Memory	1933
15.2.3.5. Certificate signing requests management	1934
15.2.3.6. Networking requirements for user-provisioned infrastructure	1934
15.2.3.6.1. Network connectivity requirements	1934
NTP configuration for user-provisioned infrastructure	1935
15.2.3.7. User-provisioned DNS requirements	1936
15.2.3.7.1. Example DNS configuration for user-provisioned clusters	1937
15.2.3.8. Load balancing requirements for user-provisioned infrastructure	1940
15.2.3.8.1. Example load balancer configuration for user-provisioned clusters	1941
15.2.4. Preparing the user-provisioned infrastructure	1943
15.2.5. Validating DNS resolution for user-provisioned infrastructure	1944
15.2.6. Generating a key pair for cluster node SSH access	1947
15.2.7. Obtaining the installation program	1949
15.2.8. Installing the OpenShift CLI by downloading the binary	1949
Installing the OpenShift CLI on Linux	1950

Installing the OpenShift CLI on Windows	1950
Installing the OpenShift CLI on macOS	1951
15.2.9. Manually creating the installation configuration file	1951
15.2.9.1. Installation configuration parameters	1952
15.2.9.1.1. Required configuration parameters	1952
15.2.9.1.2. Network configuration parameters	1954
15.2.9.1.3. Optional configuration parameters	1955
15.2.9.2. Sample install-config.yaml file for IBM Z	1960
15.2.9.3. Configuring the cluster-wide proxy during installation	1963
15.2.9.4. Configuring a three-node cluster	1964
15.2.10. Cluster Network Operator configuration	1965
15.2.10.1. Cluster Network Operator configuration object	1966
defaultNetwork object configuration	1966
Configuration for the OpenShift SDN CNI cluster network provider	1967
Configuration for the OVN-Kubernetes CNI cluster network provider	1968
kubeProxyConfig object configuration	1970
15.2.11. Creating the Kubernetes manifest and Ignition config files	1971
15.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1973
15.2.12.1. Advanced RHCOS installation reference	1976
15.2.12.1.1. Networking and bonding options for ISO installations	1976
Configuring DHCP or static IP addresses	1976
Configuring an IP address without a static hostname	1977
Specifying multiple network interfaces	1977
Configuring default gateway and route	1977
Disabling DHCP on a single interface	1978
Combining DHCP and static IP configurations	1978
Configuring VLANs on individual interfaces	1978
Providing multiple DNS servers	1978
Bonding multiple network interfaces to a single interface	1978
Bonding multiple network interfaces to a single interface	1979
Using network teaming	1979
15.2.13. Waiting for the bootstrap process to complete	1979
15.2.14. Logging in to the cluster by using the CLI	1980
15.2.15. Approving the certificate signing requests for your machines	1981
15.2.16. Initial Operator configuration	1983
15.2.16.1. Image registry storage configuration	1984
15.2.16.1.1. Configuring registry storage for IBM Z	1985
15.2.16.1.2. Configuring storage for the image registry in non-production clusters	1986
15.2.17. Completing installation on user-provisioned infrastructure	1987
15.2.18. Telemetry access for OpenShift Container Platform	1989
15.2.19. Next steps	1989
15.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK	1990
15.3.1. Prerequisites	1990
15.3.2. About installations in restricted networks	1990
15.3.2.1. Additional limits	1991
15.3.3. Internet access for OpenShift Container Platform	1991
15.3.4. Requirements for a cluster with user-provisioned infrastructure	1991
15.3.4.1. Required machines for cluster installation	1992
15.3.4.2. Minimum resource requirements for cluster installation	1992
15.3.4.3. Minimum IBM Z system environment	1993
Hardware requirements	1993
Operating system requirements	1993
IBM Z network connectivity requirements	1993

Disk storage for the z/VM guest virtual machines	1993
Storage / Main Memory	1994
15.3.4.4. Preferred IBM Z system environment	1994
Hardware requirements	1994
Operating system requirements	1994
IBM Z network connectivity requirements	1994
Disk storage for the z/VM guest virtual machines	1994
Storage / Main Memory	1995
15.3.4.5. Certificate signing requests management	1995
15.3.4.6. Networking requirements for user-provisioned infrastructure	1995
15.3.4.6.1. Setting the cluster node hostnames through DHCP	1996
15.3.4.6.2. Network connectivity requirements	1996
NTP configuration for user-provisioned infrastructure	1997
15.3.4.7. User-provisioned DNS requirements	1997
15.3.4.7.1. Example DNS configuration for user-provisioned clusters	1999
15.3.4.8. Load balancing requirements for user-provisioned infrastructure	2001
15.3.4.8.1. Example load balancer configuration for user-provisioned clusters	2003
15.3.5. Preparing the user-provisioned infrastructure	2005
15.3.6. Validating DNS resolution for user-provisioned infrastructure	2006
15.3.7. Generating a key pair for cluster node SSH access	2009
15.3.8. Manually creating the installation configuration file	2010
15.3.8.1. Installation configuration parameters	2011
15.3.8.1.1. Required configuration parameters	2011
15.3.8.1.2. Network configuration parameters	2013
15.3.8.1.3. Optional configuration parameters	2015
15.3.8.2. Sample install-config.yaml file for IBM Z	2020
15.3.8.3. Configuring the cluster-wide proxy during installation	2023
15.3.8.4. Configuring a three-node cluster	2025
15.3.9. Cluster Network Operator configuration	2026
15.3.9.1. Cluster Network Operator configuration object	2026
defaultNetwork object configuration	2027
Configuration for the OpenShift SDN CNI cluster network provider	2027
Configuration for the OVN-Kubernetes CNI cluster network provider	2029
kubeProxyConfig object configuration	2031
15.3.10. Creating the Kubernetes manifest and Ignition config files	2031
15.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2033
15.3.11.1. Advanced RHCOS installation reference	2036
15.3.11.1.1. Networking and bonding options for ISO installations	2036
Configuring DHCP or static IP addresses	2037
Configuring an IP address without a static hostname	2037
Specifying multiple network interfaces	2038
Configuring default gateway and route	2038
Disabling DHCP on a single interface	2038
Combining DHCP and static IP configurations	2038
Configuring VLANs on individual interfaces	2038
Providing multiple DNS servers	2039
Bonding multiple network interfaces to a single interface	2039
Bonding multiple network interfaces to a single interface	2039
Using network teaming	2040
15.3.12. Waiting for the bootstrap process to complete	2040
15.3.13. Logging in to the cluster by using the CLI	2041
15.3.14. Approving the certificate signing requests for your machines	2041
15.3.15. Initial Operator configuration	2044

15.3.15.1. Disabling the default OperatorHub sources	2045
15.3.15.2. Image registry storage configuration	2045
15.3.15.2.1. Configuring registry storage for IBM Z	2046
15.3.15.2.2. Configuring storage for the image registry in non-production clusters	2047
15.3.16. Completing installation on user-provisioned infrastructure	2048
15.3.17. Next steps	2050
<b>CHAPTER 16. INSTALLING WITH RHEL KVM ON IBM Z AND LINUXONE</b>	<b>2051</b>
16.1. PREPARING TO INSTALL WITH RHEL KVM ON IBM Z AND LINUXONE	2051
16.1.1. Prerequisites	2051
16.1.2. Choosing a method to install OpenShift Container Platform with RHEL KVM on IBM Z or LinuxONE	2051
16.2. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE	2051
16.2.1. Prerequisites	2051
16.2.2. Internet access for OpenShift Container Platform	2052
16.2.3. Machine requirements for a cluster with user-provisioned infrastructure	2052
16.2.3.1. Required machines	2052
16.2.3.2. Network connectivity requirements	2053
16.2.3.3. IBM Z network connectivity requirements	2053
16.2.3.4. Host machine resource requirements	2053
16.2.3.5. Minimum IBM Z system environment	2054
Hardware requirements	2054
Operating system requirements	2054
16.2.3.6. Minimum resource requirements	2054
16.2.3.7. Preferred IBM Z system environment	2055
Hardware requirements	2055
Operating system requirements	2055
16.2.3.8. Preferred resource requirements	2055
16.2.3.9. Certificate signing requests management	2055
16.2.3.10. Networking requirements for user-provisioned infrastructure	2056
16.2.3.10.1. Setting the cluster node hostnames through DHCP	2056
16.2.3.10.2. Network connectivity requirements	2056
NTP configuration for user-provisioned infrastructure	2058
16.2.3.11. User-provisioned DNS requirements	2058
16.2.3.11.1. Example DNS configuration for user-provisioned clusters	2060
16.2.3.12. Load balancing requirements for user-provisioned infrastructure	2062
16.2.3.12.1. Example load balancer configuration for user-provisioned clusters	2064
16.2.4. Preparing the user-provisioned infrastructure	2066
16.2.5. Validating DNS resolution for user-provisioned infrastructure	2068
16.2.6. Generating a key pair for cluster node SSH access	2070
16.2.7. Obtaining the installation program	2072
16.2.8. Installing the OpenShift CLI by downloading the binary	2072
Installing the OpenShift CLI on Linux	2073
Installing the OpenShift CLI on Windows	2073
Installing the OpenShift CLI on macOS	2074
16.2.9. Manually creating the installation configuration file	2074
16.2.9.1. Installation configuration parameters	2075
16.2.9.1.1. Required configuration parameters	2075
16.2.9.1.2. Network configuration parameters	2077
16.2.9.1.3. Optional configuration parameters	2078
16.2.9.2. Sample install-config.yaml file for IBM Z	2083
16.2.9.3. Configuring the cluster-wide proxy during installation	2086
16.2.9.4. Configuring a three-node cluster	2087

16.2.10. Cluster Network Operator configuration	2088
16.2.10.1. Cluster Network Operator configuration object	2089
defaultNetwork object configuration	2089
Configuration for the OpenShift SDN CNI cluster network provider	2090
Configuration for the OVN-Kubernetes CNI cluster network provider	2091
kubeProxyConfig object configuration	2093
16.2.11. Creating the Kubernetes manifest and Ignition config files	2094
16.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2096
16.2.12.1. Fast-track installation by using a prepackaged QCOW2 disk image	2096
16.2.12.2. Full installation on a new QCOW2 disk image	2097
16.2.12.3. Advanced RHCOS installation reference	2098
16.2.12.3.1. Networking options for ISO installations	2099
Configuring DHCP or static IP addresses	2099
Configuring an IP address without a static hostname	2099
Specifying multiple network interfaces	2100
Configuring default gateway and route	2100
Disabling DHCP on a single interface	2100
Combining DHCP and static IP configurations	2100
Configuring VLANs on individual interfaces	2101
Providing multiple DNS servers	2101
16.2.13. Waiting for the bootstrap process to complete	2101
16.2.14. Logging in to the cluster by using the CLI	2102
16.2.15. Approving the certificate signing requests for your machines	2102
16.2.16. Initial Operator configuration	2105
16.2.16.1. Image registry storage configuration	2106
16.2.16.1.1. Configuring registry storage for IBM Z	2106
16.2.16.1.2. Configuring storage for the image registry in non-production clusters	2108
16.2.17. Completing installation on user-provisioned infrastructure	2108
16.2.18. Telemetry access for OpenShift Container Platform	2111
16.2.19. Next steps	2111
16.3. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK	2111
16.3.1. Prerequisites	2111
16.3.2. About installations in restricted networks	2112
16.3.2.1. Additional limits	2112
16.3.3. Internet access for OpenShift Container Platform	2113
16.3.4. Machine requirements for a cluster with user-provisioned infrastructure	2113
16.3.4.1. Required machines	2113
16.3.4.2. Network connectivity requirements	2114
16.3.4.3. IBM Z network connectivity requirements	2114
16.3.4.4. Host machine resource requirements	2114
16.3.4.5. Minimum IBM Z system environment	2114
Hardware requirements	2114
Operating system requirements	2115
16.3.4.6. Minimum resource requirements	2115
16.3.4.7. Preferred IBM Z system environment	2115
Hardware requirements	2115
Operating system requirements	2116
16.3.4.8. Preferred resource requirements	2116
16.3.4.9. Certificate signing requests management	2116
16.3.4.10. Networking requirements for user-provisioned infrastructure	2116
16.3.4.10.1. Setting the cluster node hostnames through DHCP	2117
16.3.4.10.2. Network connectivity requirements	2117
NTP configuration for user-provisioned infrastructure	2118

16.3.4.11. User-provisioned DNS requirements	2119
16.3.4.11.1. Example DNS configuration for user-provisioned clusters	2120
16.3.4.12. Load balancing requirements for user-provisioned infrastructure	2123
16.3.4.12.1. Example load balancer configuration for user-provisioned clusters	2124
16.3.5. Preparing the user-provisioned infrastructure	2126
16.3.6. Validating DNS resolution for user-provisioned infrastructure	2128
16.3.7. Generating a key pair for cluster node SSH access	2130
16.3.8. Manually creating the installation configuration file	2132
16.3.8.1. Installation configuration parameters	2133
16.3.8.1.1. Required configuration parameters	2133
16.3.8.1.2. Network configuration parameters	2135
16.3.8.1.3. Optional configuration parameters	2136
16.3.8.2. Sample install-config.yaml file for IBM Z	2141
16.3.8.3. Configuring the cluster-wide proxy during installation	2144
16.3.8.4. Configuring a three-node cluster	2146
16.3.9. Cluster Network Operator configuration	2147
16.3.9.1. Cluster Network Operator configuration object	2147
defaultNetwork object configuration	2148
Configuration for the OpenShift SDN CNI cluster network provider	2148
Configuration for the OVN-Kubernetes CNI cluster network provider	2150
kubeProxyConfig object configuration	2152
16.3.10. Creating the Kubernetes manifest and Ignition config files	2152
16.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2154
16.3.11.1. Fast-track installation by using a prepackaged QCOW2 disk image	2154
16.3.11.2. Full installation on a new QCOW2 disk image	2155
16.3.11.3. Advanced RHCOS installation reference	2157
16.3.11.3.1. Networking options for ISO installations	2157
Configuring DHCP or static IP addresses	2157
Configuring an IP address without a static hostname	2158
Specifying multiple network interfaces	2158
Configuring default gateway and route	2158
Disabling DHCP on a single interface	2159
Combining DHCP and static IP configurations	2159
Configuring VLANs on individual interfaces	2159
Providing multiple DNS servers	2159
16.3.12. Waiting for the bootstrap process to complete	2159
16.3.13. Logging in to the cluster by using the CLI	2160
16.3.14. Approving the certificate signing requests for your machines	2161
16.3.15. Initial Operator configuration	2163
16.3.15.1. Disabling the default OperatorHub sources	2164
16.3.15.2. Image registry storage configuration	2165
16.3.15.2.1. Configuring registry storage for IBM Z	2165
16.3.15.2.2. Configuring storage for the image registry in non-production clusters	2167
16.3.16. Completing installation on user-provisioned infrastructure	2167
16.3.17. Next steps	2170
<b>CHAPTER 17. INSTALLING ON IBM POWER</b> .....	<b>2171</b>
17.1. PREPARING TO INSTALL ON IBM POWER	2171
17.1.1. Prerequisites	2171
17.1.2. Choosing a method to install OpenShift Container Platform on IBM Power	2171
17.2. INSTALLING A CLUSTER ON IBM POWER	2171
17.2.1. Prerequisites	2171
17.2.2. Internet access for OpenShift Container Platform	2172

17.2.3. Requirements for a cluster with user-provisioned infrastructure	2172
17.2.3.1. Required machines for cluster installation	2172
17.2.3.2. Minimum resource requirements for cluster installation	2173
17.2.3.3. Minimum IBM Power requirements	2173
Hardware requirements	2173
Operating system requirements	2174
Disk storage for the IBM Power guest virtual machines	2174
Network for the PowerVM guest virtual machines	2174
Storage / main memory	2174
17.2.3.4. Recommended IBM Power system requirements	2174
Hardware requirements	2174
Operating system requirements	2174
Disk storage for the IBM Power guest virtual machines	2174
Network for the PowerVM guest virtual machines	2174
Storage / main memory	2175
17.2.3.5. Certificate signing requests management	2175
17.2.3.6. Networking requirements for user-provisioned infrastructure	2175
17.2.3.6.1. Setting the cluster node hostnames through DHCP	2175
17.2.3.6.2. Network connectivity requirements	2176
NTP configuration for user-provisioned infrastructure	2177
17.2.3.7. User-provisioned DNS requirements	2177
17.2.3.7.1. Example DNS configuration for user-provisioned clusters	2179
17.2.3.8. Load balancing requirements for user-provisioned infrastructure	2181
17.2.3.8.1. Example load balancer configuration for user-provisioned clusters	2183
17.2.4. Preparing the user-provisioned infrastructure	2185
17.2.5. Validating DNS resolution for user-provisioned infrastructure	2187
17.2.6. Generating a key pair for cluster node SSH access	2189
17.2.7. Obtaining the installation program	2191
17.2.8. Installing the OpenShift CLI by downloading the binary	2192
Installing the OpenShift CLI on Linux	2192
Installing the OpenShift CLI on Windows	2192
Installing the OpenShift CLI on macOS	2193
17.2.9. Manually creating the installation configuration file	2193
17.2.9.1. Installation configuration parameters	2194
17.2.9.1.1. Required configuration parameters	2194
17.2.9.1.2. Network configuration parameters	2196
17.2.9.1.3. Optional configuration parameters	2198
17.2.9.2. Sample install-config.yaml file for IBM Power	2203
17.2.9.3. Configuring the cluster-wide proxy during installation	2206
17.2.9.4. Configuring a three-node cluster	2207
17.2.10. Cluster Network Operator configuration	2208
17.2.10.1. Cluster Network Operator configuration object	2209
defaultNetwork object configuration	2209
Configuration for the OpenShift SDN CNI cluster network provider	2210
Configuration for the OVN-Kubernetes CNI cluster network provider	2211
kubeProxyConfig object configuration	2213
17.2.11. Creating the Kubernetes manifest and Ignition config files	2214
17.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2216
17.2.12.1. Installing RHCOS by using an ISO image	2216
17.2.12.1.1. Advanced RHCOS installation reference	2219
17.2.12.1.1.1. Networking and bonding options for ISO installations	2219
Configuring DHCP or static IP addresses	2220
Configuring an IP address without a static hostname	2220

Specifying multiple network interfaces	2221
Configuring default gateway and route	2221
Disabling DHCP on a single interface	2221
Combining DHCP and static IP configurations	2221
Configuring VLANs on individual interfaces	2221
Providing multiple DNS servers	2222
Bonding multiple network interfaces to a single interface	2222
Bonding multiple network interfaces to a single interface	2222
Using network teaming	2223
17.2.12.2. Installing RHCOS by using PXE booting	2223
17.2.12.3. Enabling multipathing with kernel arguments on RHCOS	2226
17.2.13. Waiting for the bootstrap process to complete	2228
17.2.14. Logging in to the cluster by using the CLI	2229
17.2.15. Approving the certificate signing requests for your machines	2229
17.2.16. Initial Operator configuration	2232
17.2.16.1. Image registry storage configuration	2233
17.2.16.1.1. Configuring registry storage for IBM Power	2233
17.2.16.1.2. Configuring storage for the image registry in non-production clusters	2235
17.2.17. Completing installation on user-provisioned infrastructure	2235
17.2.18. Telemetry access for OpenShift Container Platform	2238
17.2.19. Next steps	2238
17.3. INSTALLING A CLUSTER ON IBM POWER IN A RESTRICTED NETWORK	2238
17.3.1. Prerequisites	2238
17.3.2. About installations in restricted networks	2239
17.3.2.1. Additional limits	2239
17.3.3. Internet access for OpenShift Container Platform	2239
17.3.4. Requirements for a cluster with user-provisioned infrastructure	2240
17.3.4.1. Required machines for cluster installation	2240
17.3.4.2. Minimum resource requirements for cluster installation	2241
17.3.4.3. Minimum IBM Power requirements	2241
Hardware requirements	2241
Operating system requirements	2241
Disk storage for the IBM Power guest virtual machines	2241
Network for the PowerVM guest virtual machines	2242
Storage / main memory	2242
17.3.4.4. Recommended IBM Power system requirements	2242
Hardware requirements	2242
Operating system requirements	2242
Disk storage for the IBM Power guest virtual machines	2242
Network for the PowerVM guest virtual machines	2242
Storage / main memory	2242
17.3.4.5. Certificate signing requests management	2242
17.3.4.6. Networking requirements for user-provisioned infrastructure	2243
17.3.4.6.1. Setting the cluster node hostnames through DHCP	2243
17.3.4.6.2. Network connectivity requirements	2243
NTP configuration for user-provisioned infrastructure	2244
17.3.4.7. User-provisioned DNS requirements	2245
17.3.4.7.1. Example DNS configuration for user-provisioned clusters	2247
17.3.4.8. Load balancing requirements for user-provisioned infrastructure	2249
17.3.4.8.1. Example load balancer configuration for user-provisioned clusters	2251
17.3.5. Preparing the user-provisioned infrastructure	2253
17.3.6. Validating DNS resolution for user-provisioned infrastructure	2254
17.3.7. Generating a key pair for cluster node SSH access	2257

17.3.8. Manually creating the installation configuration file	2258
17.3.8.1. Installation configuration parameters	2259
17.3.8.1.1. Required configuration parameters	2260
17.3.8.1.2. Network configuration parameters	2261
17.3.8.1.3. Optional configuration parameters	2263
17.3.8.2. Sample install-config.yaml file for IBM Power	2268
17.3.8.3. Configuring the cluster-wide proxy during installation	2271
17.3.8.4. Configuring a three-node cluster	2273
17.3.9. Cluster Network Operator configuration	2274
17.3.9.1. Cluster Network Operator configuration object	2274
defaultNetwork object configuration	2275
Configuration for the OpenShift SDN CNI cluster network provider	2275
Configuration for the OVN-Kubernetes CNI cluster network provider	2276
kubeProxyConfig object configuration	2278
17.3.10. Creating the Kubernetes manifest and Ignition config files	2279
17.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2281
17.3.11.1. Installing RHCOS by using an ISO image	2281
17.3.11.1.1. Advanced RHCOS installation reference	2284
17.3.11.1.1.1. Networking and bonding options for ISO installations	2284
Configuring DHCP or static IP addresses	2285
Configuring an IP address without a static hostname	2285
Specifying multiple network interfaces	2286
Configuring default gateway and route	2286
Disabling DHCP on a single interface	2286
Combining DHCP and static IP configurations	2286
Configuring VLANs on individual interfaces	2286
Providing multiple DNS servers	2287
Bonding multiple network interfaces to a single interface	2287
Bonding multiple network interfaces to a single interface	2287
Using network teaming	2288
17.3.11.2. Installing RHCOS by using PXE booting	2288
17.3.11.3. Enabling multipathing with kernel arguments on RHCOS	2291
17.3.12. Waiting for the bootstrap process to complete	2293
17.3.13. Logging in to the cluster by using the CLI	2294
17.3.14. Approving the certificate signing requests for your machines	2294
17.3.15. Initial Operator configuration	2297
17.3.15.1. Disabling the default OperatorHub sources	2298
17.3.15.2. Image registry storage configuration	2298
17.3.15.2.1. Changing the image registry's management state	2299
17.3.15.2.2. Configuring registry storage for IBM Power	2299
17.3.15.2.3. Configuring storage for the image registry in non-production clusters	2300
17.3.16. Completing installation on user-provisioned infrastructure	2301
17.3.17. Next steps	2304
<b>CHAPTER 18. INSTALLING ON OPENSTACK</b> .....	<b>2305</b>
18.1. PREPARING TO INSTALL ON OPENSTACK	2305
18.1.1. Prerequisites	2305
18.1.2. Choosing a method to install OpenShift Container Platform on OpenStack	2305
18.1.2.1. Installing a cluster on installer-provisioned infrastructure	2305
18.1.2.2. Installing a cluster on user-provisioned infrastructure	2305
18.1.3. Scanning RHOSP endpoints for legacy HTTPS certificates	2306
18.1.3.1. Scanning RHOSP endpoints for legacy HTTPS certificates manually	2308
18.2. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS	2309

18.2.1. Prerequisites	2309
18.2.2. Resource guidelines for installing OpenShift Container Platform on RHOSP	2310
18.2.2.1. Control plane machines	2311
18.2.2.2. Compute machines	2311
18.2.2.3. Bootstrap machine	2311
18.2.3. Internet access for OpenShift Container Platform	2312
18.2.4. Enabling Swift on RHOSP	2312
18.2.5. Configuring an image registry with custom storage on clusters that run on RHOSP	2313
18.2.6. Verifying external network access	2315
18.2.7. Defining parameters for the installation program	2316
18.2.8. Setting cloud provider options	2317
18.2.8.1. External load balancers that use pre-defined floating IP addresses	2319
18.2.9. Obtaining the installation program	2319
18.2.10. Creating the installation configuration file	2320
18.2.10.1. Configuring the cluster-wide proxy during installation	2321
18.2.11. Installation configuration parameters	2323
18.2.11.1. Required configuration parameters	2323
18.2.11.2. Network configuration parameters	2325
18.2.11.3. Optional configuration parameters	2326
18.2.11.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2331
18.2.11.5. Optional RHOSP configuration parameters	2332
18.2.11.6. Custom subnets in RHOSP deployments	2337
18.2.11.7. Deploying a cluster with bare metal machines	2338

18.9.9.2.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2647
18.9.9.2.5. Optional RHOSP configuration parameters	2648
18.9.9.3. Sample customized install-config.yaml file for restricted OpenStack installations	2653
18.9.10. Generating a key pair for cluster node SSH access	2654
18.9.11. Enabling access to the environment	2656
18.9.11.1. Enabling access with floating IP addresses	2656
18.9.11.2. Completing installation without floating IP addresses	2657
18.9.12. Deploying the cluster	2658
18.9.13. Verifying cluster status	2659
18.9.14. Logging in to the cluster by using the CLI	2660
18.9.15. Disabling the default OperatorHub sources	2661
18.9.16. Telemetry access for OpenShift Container Platform	2661
18.9.17. Next steps	2661
18.10. OPENSTACK CLOUD CONFIGURATION REFERENCE GUIDE	2662
18.10.1. OpenStack cloud provider options	2662
18.10.1.1. Global options	2662
18.10.1.2. Load balancer options	2663
18.10.1.3. Metadata options	2664
18.11. UNINSTALLING A CLUSTER ON OPENSTACK	2665
18.11.1. Removing a cluster that uses installer-provisioned infrastructure	2665
18.12. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE	2666
18.12.1. Downloading playbook dependencies	2666
18.12.2. Removing a cluster from RHOSP that uses your own infrastructure	2667
<b>CHAPTER 19. INSTALLING ON RHV</b>	<b>2668</b>
19.1. PREPARING TO INSTALL ON RED HAT VIRTUALIZATION (RHV)	2668
19.1.1. Prerequisites	2668
19.1.2. Choosing a method to install OpenShift Container Platform on RHV	2668
19.1.2.1. Installing a cluster on installer-provisioned infrastructure	2668
19.1.2.2. Installing a cluster on user-provisioned infrastructure	2668
19.2. INSTALLING A CLUSTER QUICKLY ON RHV	2669
19.2.1. Prerequisites	2669
19.2.2. Internet access for OpenShift Container Platform	2670
19.2.3. Requirements for the RHV environment	2670
19.2.4. Verifying the requirements for the RHV environment	2672
19.2.5. Preparing the network environment on RHV	2674
19.2.6. Installing OpenShift Container Platform on RHV in insecure mode	2674
19.2.7. Generating a key pair for cluster node SSH access	2675
19.2.8. Obtaining the installation program	2677
19.2.9. Deploying the cluster	2678
19.2.10. Installing the OpenShift CLI by downloading the binary	2680
Installing the OpenShift CLI on Linux	2681
Installing the OpenShift CLI on Windows	2681
Installing the OpenShift CLI on macOS	2682
19.2.11. Logging in to the cluster by using the CLI	2682
19.2.12. Verifying cluster status	2683
19.2.13. Accessing the OpenShift Container Platform web console on RHV	2683
19.2.14. Telemetry access for OpenShift Container Platform	2684
19.2.15. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)	2684

19.2.15.1. CPU load increases and nodes go into a Not Ready state	2684
19.2.15.2. Trouble connecting the OpenShift Container Platform cluster API	2685
19.2.16. Post-installation tasks	2685
19.3. INSTALLING A CLUSTER ON RHV WITH CUSTOMIZATIONS	2685
19.3.1. Prerequisites	2686
19.3.2. Internet access for OpenShift Container Platform	2687
19.3.3. Requirements for the RHV environment	2687
19.3.4. Verifying the requirements for the RHV environment	2689
19.3.5. Preparing the network environment on RHV	2691
19.3.6. Installing OpenShift Container Platform on RHV in insecure mode	2691
19.3.7. Generating a key pair for cluster node SSH access	2692
19.3.8. Obtaining the installation program	2694
19.3.9. Creating the installation configuration file	2695
19.3.9.1. Example install-config.yaml files for Red Hat Virtualization (RHV)	2697
Example default install-config.yaml file	2698
Example minimal install-config.yaml file	2698
Example Custom machine pools in an install-config.yaml file	2699
Example non-enforcing affinity group	2699
Example removing all affinity groups for a non-production lab setup	2700
19.3.9.2. Installation configuration parameters	2701
19.3.9.2.1. Required configuration parameters	2701
19.3.9.2.2. Network configuration parameters	2702
19.3.9.2.3. Optional configuration parameters	2704
19.3.9.2.4. Additional Red Hat Virtualization (RHV) configuration parameters	2709
19.3.9.2.5. Additional RHV parameters for machine pools	2711
19.3.10. Deploying the cluster	2715
19.3.11. Installing the OpenShift CLI by downloading the binary	2716
Installing the OpenShift CLI on Linux	2716
Installing the OpenShift CLI on Windows	2717
Installing the OpenShift CLI on macOS	2717
19.3.12. Logging in to the cluster by using the CLI	2718
19.3.13. Verifying cluster status	2718
19.3.14. Accessing the OpenShift Container Platform web console on RHV	2719
19.3.15. Telemetry access for OpenShift Container Platform	2719
19.3.16. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)	2720
19.3.16.1. CPU load increases and nodes go into a Not Ready state	2720
19.3.16.2. Trouble connecting the OpenShift Container Platform cluster API	2720
19.3.17. Post-installation tasks	2721
19.3.18. Next steps	2721
19.4. INSTALLING A CLUSTER ON RHV WITH USER-PROVISIONED INFRASTRUCTURE	2721
19.4.1. Prerequisites	2722
19.4.2. Internet access for OpenShift Container Platform	2722
19.4.3. Requirements for the RHV environment	2723
19.4.4. Verifying the requirements for the RHV environment	2724
19.4.5. Networking requirements for user-provisioned infrastructure	2726
19.4.5.1. Setting the cluster node hostnames through DHCP	2727
19.4.5.2. Network connectivity requirements	2727
NTP configuration for user-provisioned infrastructure	2729
19.4.6. Setting up the installation machine	2729
19.4.7. Installing OpenShift Container Platform on RHV in insecure mode	2729
19.4.8. Generating a key pair for cluster node SSH access	2730
19.4.9. Obtaining the installation program	2732
19.4.10. Downloading the Ansible playbooks	2733

---

19.4.11. The inventory.yml file	2733
19.4.12. Specifying the RHCOS image settings	2737
19.4.13. Creating the install config file	2738
19.4.14. Customizing install-config.yaml	2739
19.4.15. Generate manifest files	2740
19.4.16. Making control-plane nodes non-schedulable	2741
19.4.17. Building the Ignition files	2742
19.4.18. Creating templates and virtual machines	2742
19.4.19. Creating the bootstrap machine	2743
19.4.20. Creating the control plane nodes	2744
19.4.21. Verifying cluster status	2744
19.4.22. Removing the bootstrap machine	2745
19.4.23. Creating the worker nodes and completing the installation	2745
19.4.24. Telemetry access for OpenShift Container Platform	2747
19.5. INSTALLING A CLUSTER ON RHV IN A RESTRICTED NETWORK	2747
19.5.1. Prerequisites	2747
19.5.2. About installations in restricted networks	2748
19.5.2.1. Additional limits	2748
19.5.3. Internet access for OpenShift Container Platform	2748
19.5.4. Requirements for the RHV environment	2749
19.5.5. Verifying the requirements for the RHV environment	2750
19.5.6. Networking requirements for user-provisioned infrastructure	2752
19.5.6.1. Setting the cluster node hostnames through DHCP	2753
19.5.6.2. Network connectivity requirements	2753
NTP configuration for user-provisioned infrastructure	2755
19.5.7. User-provisioned DNS requirements	2755
19.5.7.1. Example DNS configuration for user-provisioned clusters	2757
19.5.7.2. Load balancing requirements for user-provisioned infrastructure	2759
19.5.7.2.1. Example load balancer configuration for user-provisioned clusters	2761
19.5.8. Setting up the installation machine	2763
19.5.9. Setting up the CA certificate for RHV	2763
19.5.10. Generating a key pair for cluster node SSH access	2764
19.5.11. Downloading the Ansible playbooks	2766
19.5.12. The inventory.yml file	2766
19.5.13. Specifying the RHCOS image settings	2770
19.5.14. Creating the install config file	2771
19.5.15. Sample install-config.yaml file for RHV	2772
19.5.15.1. Configuring the cluster-wide proxy during installation	2775
19.5.16. Customizing install-config.yaml	2776
19.5.17. Generate manifest files	2777
19.5.18. Making control-plane nodes non-schedulable	2779
19.5.19. Building the Ignition files	2779
19.5.20. Creating templates and virtual machines	2780
19.5.21. Creating the bootstrap machine	2781
19.5.22. Creating the control plane nodes	2781
19.5.23. Verifying cluster status	2782
19.5.24. Removing the bootstrap machine	2782
19.5.25. Creating the worker nodes and completing the installation	2783
19.5.26. Telemetry access for OpenShift Container Platform	2784
19.5.27. Disabling the default OperatorHub sources	2785
19.6. UNINSTALLING A CLUSTER ON RHV	2785
19.6.1. Removing a cluster that uses installer-provisioned infrastructure	2785
19.6.2. Removing a cluster that uses user-provisioned infrastructure	2786

---

<b>CHAPTER 20. INSTALLING ON VSPHERE</b> .....	<b>2787</b>
20.1. PREPARING TO INSTALL ON VSPHERE	2787
20.1.1. Prerequisites	2787
20.1.2. Choosing a method to install OpenShift Container Platform on vSphere	2787
20.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2787
20.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2788
20.1.3. VMware vSphere infrastructure requirements	2788
20.1.4. VMware vSphere CSI Driver Operator requirements	2789
20.1.5. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2790
20.2. INSTALLING A CLUSTER ON VSPHERE	2790
20.2.1. Prerequisites	2790
20.2.2. Internet access for OpenShift Container Platform	2791
20.2.3. VMware vSphere infrastructure requirements	2791
20.2.4. Network connectivity requirements	2793
20.2.5. VMware vSphere CSI Driver Operator requirements	2794
20.2.6. vCenter requirements	2794
Required vCenter account privileges	2794
Using OpenShift Container Platform with vMotion	2803
Cluster resources	2804
Cluster limits	2804
Networking requirements	2804
Required IP Addresses	2804
DNS records	2805
20.2.7. Generating a key pair for cluster node SSH access	2805
20.2.8. Obtaining the installation program	2807
20.2.9. Adding vCenter root CA certificates to your system trust	2808
20.2.10. Deploying the cluster	2809
20.2.11. Installing the OpenShift CLI by downloading the binary	2811
Installing the OpenShift CLI on Linux	2811
Installing the OpenShift CLI on Windows	2812
Installing the OpenShift CLI on macOS	2812
20.2.12. Logging in to the cluster by using the CLI	2813
20.2.13. Creating registry storage	2813
20.2.13.1. Image registry removed during installation	2813
20.2.13.2. Image registry storage configuration	2813
20.2.13.2.1. Configuring registry storage for VMware vSphere	2814
20.2.13.2.2. Configuring block registry storage for VMware vSphere	2815
20.2.14. Backing up VMware vSphere volumes	2817
20.2.15. Telemetry access for OpenShift Container Platform	2817
20.2.16. Next steps	2817
20.3. INSTALLING A CLUSTER ON VSPHERE WITH CUSTOMIZATIONS	2817
20.3.1. Prerequisites	2818
20.3.2. Internet access for OpenShift Container Platform	2818
20.3.3. VMware vSphere infrastructure requirements	2818
20.3.4. Network connectivity requirements	2820
20.3.5. VMware vSphere CSI Driver Operator requirements	2821
20.3.6. vCenter requirements	2822
Required vCenter account privileges	2822
Using OpenShift Container Platform with vMotion	2831
Cluster resources	2831
Cluster limits	2832
Networking requirements	2832

Required IP Addresses	2832
DNS records	2832
20.3.7. Generating a key pair for cluster node SSH access	2833
20.3.8. Obtaining the installation program	2835
20.3.9. Adding vCenter root CA certificates to your system trust	2835
20.3.10. Creating the installation configuration file	2836
20.3.10.1. Installation configuration parameters	2838
20.3.10.1.1. Required configuration parameters	2838
20.3.10.1.2. Network configuration parameters	2839
20.3.10.1.3. Optional configuration parameters	2841
20.3.10.1.4. Additional VMware vSphere configuration parameters	2846
20.3.10.1.5. Optional VMware vSphere machine pool configuration parameters	2847
20.3.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2848
20.3.10.3. Configuring the cluster-wide proxy during installation	2850
20.3.11. Deploying the cluster	2851
20.3.12. Installing the OpenShift CLI by downloading the binary	2853
Installing the OpenShift CLI on Linux	2853
Installing the OpenShift CLI on Windows	2853
Installing the OpenShift CLI on macOS	2854
20.3.13. Logging in to the cluster by using the CLI	2854
20.3.14. Creating registry storage	2855
20.3.14.1. Image registry removed during installation	2855
20.3.14.2. Image registry storage configuration	2855
20.3.14.2.1. Configuring registry storage for VMware vSphere	2855
20.3.14.2.2. Configuring block registry storage for VMware vSphere	2857
20.3.15. Backing up VMware vSphere volumes	2858
20.3.16. Telemetry access for OpenShift Container Platform	2858
20.3.17. Next steps	2859
20.4. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS	2859
20.4.1. Prerequisites	2859
20.4.2. Internet access for OpenShift Container Platform	2860
20.4.3. VMware vSphere infrastructure requirements	2860
20.4.4. Network connectivity requirements	2861
20.4.5. VMware vSphere CSI Driver Operator requirements	2863
20.4.6. vCenter requirements	2863
Required vCenter account privileges	2863
Using OpenShift Container Platform with vMotion	2872
Cluster resources	2872
Cluster limits	2873
Networking requirements	2873
Required IP Addresses	2873
DNS records	2873
20.4.7. Generating a key pair for cluster node SSH access	2874
20.4.8. Obtaining the installation program	2876
20.4.9. Adding vCenter root CA certificates to your system trust	2876
20.4.10. Creating the installation configuration file	2877
20.4.10.1. Installation configuration parameters	2879
20.4.10.1.1. Required configuration parameters	2879
20.4.10.1.2. Network configuration parameters	2880
20.4.10.1.3. Optional configuration parameters	2882
20.4.10.1.4. Additional VMware vSphere configuration parameters	2887
20.4.10.1.5. Optional VMware vSphere machine pool configuration parameters	2888
20.4.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2889

20.4.10.3. Configuring the cluster-wide proxy during installation	2891
20.4.11. Network configuration phases	2892
20.4.12. Specifying advanced network configuration	2893
20.4.13. Cluster Network Operator configuration	2894
20.4.13.1. Cluster Network Operator configuration object	2895
defaultNetwork object configuration	2896
Configuration for the OpenShift SDN CNI cluster network provider	2896
Configuration for the OVN-Kubernetes CNI cluster network provider	2897
kubeProxyConfig object configuration	2899
20.4.14. Deploying the cluster	2900
20.4.15. Installing the OpenShift CLI by downloading the binary	2901
Installing the OpenShift CLI on Linux	2902
Installing the OpenShift CLI on Windows	2902
Installing the OpenShift CLI on macOS	2903
20.4.16. Logging in to the cluster by using the CLI	2903
20.4.17. Creating registry storage	2904
20.4.17.1. Image registry removed during installation	2904
20.4.17.2. Image registry storage configuration	2904
20.4.17.2.1. Configuring registry storage for VMware vSphere	2904
20.4.17.2.2. Configuring block registry storage for VMware vSphere	2906
20.4.18. Backing up VMware vSphere volumes	2907
20.4.19. Telemetry access for OpenShift Container Platform	2907
20.4.20. Next steps	2908
20.5. INSTALLING A CLUSTER ON VSPHERE WITH USER-PROVISIONED INFRASTRUCTURE	2908
20.5.1. Prerequisites	2908
20.5.2. Internet access for OpenShift Container Platform	2909
20.5.3. VMware vSphere infrastructure requirements	2909
20.5.4. VMware vSphere CSI Driver Operator requirements	2910
20.5.5. Requirements for a cluster with user-provisioned infrastructure	2911
20.5.5.1. Required machines for cluster installation	2911
20.5.5.2. Minimum resource requirements for cluster installation	2912
20.5.5.3. Certificate signing requests management	2913
20.5.5.4. Networking requirements for user-provisioned infrastructure	2913
20.5.5.4.1. Setting the cluster node hostnames through DHCP	2913
20.5.5.4.2. Network connectivity requirements	2913
Ethernet adaptor hardware address requirements	2915
NTP configuration for user-provisioned infrastructure	2915
20.5.5.5. User-provisioned DNS requirements	2915
20.5.5.5.1. Example DNS configuration for user-provisioned clusters	2917
20.5.5.6. Load balancing requirements for user-provisioned infrastructure	2919
20.5.5.6.1. Example load balancer configuration for user-provisioned clusters	2921
20.5.6. Preparing the user-provisioned infrastructure	2923
20.5.7. Validating DNS resolution for user-provisioned infrastructure	2925
20.5.8. Generating a key pair for cluster node SSH access	2927
20.5.9. Obtaining the installation program	2929
20.5.10. Manually creating the installation configuration file	2930
20.5.10.1. Sample install-config.yaml file for VMware vSphere	2931
20.5.10.2. Configuring the cluster-wide proxy during installation	2933
20.5.11. Creating the Kubernetes manifest and Ignition config files	2934
20.5.12. Extracting the infrastructure name	2936
20.5.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2936
20.5.14. Adding more compute machines to a cluster in vSphere	2941
20.5.15. Disk partitioning	2941

Creating a separate /var partition	2942
20.5.16. Updating the bootloader using bootupd	2944
20.5.17. Installing the OpenShift CLI by downloading the binary	2946
Installing the OpenShift CLI on Linux	2946
Installing the OpenShift CLI on Windows	2946
Installing the OpenShift CLI on macOS	2947
20.5.18. Waiting for the bootstrap process to complete	2947
20.5.19. Logging in to the cluster by using the CLI	2948
20.5.20. Approving the certificate signing requests for your machines	2949
20.5.21. Initial Operator configuration	2951
20.5.21.1. Image registry removed during installation	2952
20.5.21.2. Image registry storage configuration	2952
20.5.21.2.1. Configuring registry storage for VMware vSphere	2953
20.5.21.2.2. Configuring storage for the image registry in non-production clusters	2954
20.5.21.2.3. Configuring block registry storage for VMware vSphere	2955
20.5.22. Completing installation on user-provisioned infrastructure	2956
20.5.23. Configuring vSphere DRS anti-affinity rules for control plane nodes	2959
20.5.24. Backing up VMware vSphere volumes	2960
20.5.25. Telemetry access for OpenShift Container Platform	2960
20.5.26. Next steps	2960
20.6. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS	2961
20.6.1. Prerequisites	2961
20.6.2. Internet access for OpenShift Container Platform	2961
20.6.3. VMware vSphere infrastructure requirements	2962
20.6.4. VMware vSphere CSI Driver Operator requirements	2963
20.6.5. Requirements for a cluster with user-provisioned infrastructure	2964
20.6.5.1. Required machines for cluster installation	2964
20.6.5.2. Minimum resource requirements for cluster installation	2965
20.6.5.3. Certificate signing requests management	2965
20.6.5.4. Networking requirements for user-provisioned infrastructure	2965
20.6.5.4.1. Setting the cluster node hostnames through DHCP	2966
20.6.5.4.2. Network connectivity requirements	2966
Ethernet adaptor hardware address requirements	2967
NTP configuration for user-provisioned infrastructure	2968
20.6.5.5. User-provisioned DNS requirements	2968
20.6.5.5.1. Example DNS configuration for user-provisioned clusters	2970
20.6.5.6. Load balancing requirements for user-provisioned infrastructure	2972
20.6.5.6.1. Example load balancer configuration for user-provisioned clusters	2974
20.6.6. Preparing the user-provisioned infrastructure	2976
20.6.7. Validating DNS resolution for user-provisioned infrastructure	2977
20.6.8. Generating a key pair for cluster node SSH access	2980
20.6.9. Obtaining the installation program	2981
20.6.10. Manually creating the installation configuration file	2982
20.6.10.1. Sample install-config.yaml file for VMware vSphere	2983
20.6.10.2. Configuring the cluster-wide proxy during installation	2985
20.6.11. Network configuration phases	2987
20.6.12. Specifying advanced network configuration	2988
20.6.13. Cluster Network Operator configuration	2989
20.6.13.1. Cluster Network Operator configuration object	2989
defaultNetwork object configuration	2990
Configuration for the OpenShift SDN CNI cluster network provider	2991
Configuration for the OVN-Kubernetes CNI cluster network provider	2992
kubeProxyConfig object configuration	2994

20.6.14. Creating the Ignition config files	2995
20.6.15. Extracting the infrastructure name	2996
20.6.16. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2997
20.6.17. Adding more compute machines to a cluster in vSphere	3001
20.6.18. Disk partitioning	3002
Creating a separate /var partition	3003
20.6.19. Updating the bootloader using bootupd	3005
20.6.20. Waiting for the bootstrap process to complete	3006
20.6.21. Logging in to the cluster by using the CLI	3007
20.6.22. Approving the certificate signing requests for your machines	3008
20.6.22.1. Initial Operator configuration	3010
20.6.22.2. Image registry removed during installation	3011
20.6.22.3. Image registry storage configuration	3011
20.6.22.3.1. Configuring block registry storage for VMware vSphere	3012
20.6.23. Completing installation on user-provisioned infrastructure	3013
20.6.24. Configuring vSphere DRS anti-affinity rules for control plane nodes	3016
20.6.25. Backing up VMware vSphere volumes	3017
20.6.26. Telemetry access for OpenShift Container Platform	3017
20.6.27. Next steps	3017
20.7. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK	3018
20.7.1. Prerequisites	3018
20.7.2. About installations in restricted networks	3018
20.7.2.1. Additional limits	3019
20.7.3. Internet access for OpenShift Container Platform	3019
20.7.4. VMware vSphere infrastructure requirements	3019
20.7.5. Network connectivity requirements	3021
20.7.6. VMware vSphere CSI Driver Operator requirements	3022
20.7.7. vCenter requirements	3022
Required vCenter account privileges	3022
Using OpenShift Container Platform with vMotion	3031
Cluster resources	3031
Cluster limits	3032
Networking requirements	3032
Required IP Addresses	3032
DNS records	3032
20.7.8. Generating a key pair for cluster node SSH access	3033
20.7.9. Adding vCenter root CA certificates to your system trust	3035
20.7.10. Creating the RHCOS image for restricted network installations	3036
20.7.11. Creating the installation configuration file	3036
20.7.11.1. Installation configuration parameters	3039
20.7.11.1.1. Required configuration parameters	3039
20.7.11.1.2. Network configuration parameters	3040
20.7.11.1.3. Optional configuration parameters	3042
20.7.11.1.4. Additional VMware vSphere configuration parameters	3047
20.7.11.1.5. Optional VMware vSphere machine pool configuration parameters	3048
20.7.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3049
20.7.11.3. Configuring the cluster-wide proxy during installation	3051
20.7.12. Deploying the cluster	3053
20.7.13. Installing the OpenShift CLI by downloading the binary	3054
Installing the OpenShift CLI on Linux	3054
Installing the OpenShift CLI on Windows	3055
Installing the OpenShift CLI on macOS	3055
20.7.14. Logging in to the cluster by using the CLI	3056

20.7.15. Disabling the default OperatorHub sources	3056
20.7.16. Creating registry storage	3057
20.7.16.1. Image registry removed during installation	3057
20.7.16.2. Image registry storage configuration	3057
20.7.16.2.1. Configuring registry storage for VMware vSphere	3057
20.7.17. Telemetry access for OpenShift Container Platform	3059
20.7.18. Next steps	3059
20.8. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	3059
20.8.1. Prerequisites	3060
20.8.2. About installations in restricted networks	3060
20.8.2.1. Additional limits	3061
20.8.3. Internet access for OpenShift Container Platform	3061
20.8.4. VMware vSphere infrastructure requirements	3061
20.8.5. VMware vSphere CSI Driver Operator requirements	3063
20.8.6. Requirements for a cluster with user-provisioned infrastructure	3063
20.8.6.1. Required machines for cluster installation	3063
20.8.6.2. Minimum resource requirements for cluster installation	3064
20.8.6.3. Certificate signing requests management	3065
20.8.6.4. Networking requirements for user-provisioned infrastructure	3065
20.8.6.4.1. Setting the cluster node hostnames through DHCP	3065
20.8.6.4.2. Network connectivity requirements	3066
Ethernet adaptor hardware address requirements	3067
NTP configuration for user-provisioned infrastructure	3067
20.8.6.5. User-provisioned DNS requirements	3067
20.8.6.5.1. Example DNS configuration for user-provisioned clusters	3069
20.8.6.6. Load balancing requirements for user-provisioned infrastructure	3072
20.8.6.6.1. Example load balancer configuration for user-provisioned clusters	3073
20.8.7. Preparing the user-provisioned infrastructure	3075
20.8.8. Validating DNS resolution for user-provisioned infrastructure	3077
20.8.9. Generating a key pair for cluster node SSH access	3079
20.8.10. Manually creating the installation configuration file	3081
20.8.10.1. Sample install-config.yaml file for VMware vSphere	3082
20.8.10.2. Configuring the cluster-wide proxy during installation	3085
20.8.11. Creating the Kubernetes manifest and Ignition config files	3086
20.8.12. Configuring chrony time service	3088
20.8.13. Extracting the infrastructure name	3089
20.8.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	3090
20.8.15. Adding more compute machines to a cluster in vSphere	3094
20.8.16. Disk partitioning	3095
Creating a separate /var partition	3095
20.8.17. Updating the bootloader using bootupd	3097
20.8.18. Waiting for the bootstrap process to complete	3099
20.8.19. Logging in to the cluster by using the CLI	3100
20.8.20. Approving the certificate signing requests for your machines	3100
20.8.21. Initial Operator configuration	3103
20.8.21.1. Disabling the default OperatorHub sources	3104
20.8.21.2. Image registry storage configuration	3104
20.8.21.2.1. Configuring registry storage for VMware vSphere	3105
20.8.21.2.2. Configuring storage for the image registry in non-production clusters	3106
20.8.21.2.3. Configuring block registry storage for VMware vSphere	3107
20.8.22. Completing installation on user-provisioned infrastructure	3108
20.8.23. Configuring vSphere DRS anti-affinity rules for control plane nodes	3111

20.8.24. Backing up VMware vSphere volumes	3112
20.8.25. Telemetry access for OpenShift Container Platform	3112
20.8.26. Next steps	3112
20.9. UNINSTALLING A CLUSTER ON VSPHERE THAT USES INSTALLER-PROVISIONED INFRASTRUCTURE	3113
20.9.1. Removing a cluster that uses installer-provisioned infrastructure	3113
20.10. USING THE VSPHERE PROBLEM DETECTOR OPERATOR	3114
20.10.1. About the vSphere Problem Detector Operator	3114
20.10.2. Running the vSphere Problem Detector Operator checks	3114
20.10.3. Viewing the events from the vSphere Problem Detector Operator	3115
20.10.4. Viewing the logs from the vSphere Problem Detector Operator	3115
20.10.5. Configuration checks run by the vSphere Problem Detector Operator	3116
20.10.6. About the storage class configuration check	3117
20.10.7. Metrics for the vSphere Problem Detector Operator	3118
20.10.8. Additional resources	3118
<b>CHAPTER 21. INSTALLING ON VMC</b>	<b>3119</b>
21.1. PREPARING TO INSTALL ON VMC	3119
21.1.1. Prerequisites	3119
21.1.2. Choosing a method to install OpenShift Container Platform on VMC	3119
21.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on VMC	3119
21.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on VMC	3120
21.1.3. VMware vSphere infrastructure requirements	3120
21.1.4. VMware vSphere CSI Driver Operator requirements	3121
21.1.5. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on VMC	3122
21.2. INSTALLING A CLUSTER ON VMC	3122
21.2.1. Setting up VMC for vSphere	3122
21.2.1.1. VMC Sizer tool	3124
21.2.2. vSphere prerequisites	3125
21.2.3. Internet access for OpenShift Container Platform	3125
21.2.4. VMware vSphere infrastructure requirements	3125
21.2.5. Network connectivity requirements	3127
21.2.6. VMware vSphere CSI Driver Operator requirements	3128
21.2.7. vCenter requirements	3128
Required vCenter account privileges	3128
Using OpenShift Container Platform with vMotion	3137
Cluster resources	3138
Cluster limits	3138
Networking requirements	3138
Required IP Addresses	3138
DNS records	3139
21.2.8. Generating a key pair for cluster node SSH access	3139
21.2.9. Obtaining the installation program	3141
21.2.10. Adding vCenter root CA certificates to your system trust	3142
21.2.11. Deploying the cluster	3143
21.2.12. Installing the OpenShift CLI by downloading the binary	3145
Installing the OpenShift CLI on Linux	3145
Installing the OpenShift CLI on Windows	3146
Installing the OpenShift CLI on macOS	3146
21.2.13. Logging in to the cluster by using the CLI	3147
21.2.14. Creating registry storage	3147
21.2.14.1. Image registry removed during installation	3147

21.2.14.2. Image registry storage configuration	3148
21.2.14.2.1. Configuring registry storage for VMware vSphere	3148
21.2.14.2.2. Configuring block registry storage for VMware vSphere	3149
21.2.15. Backing up VMware vSphere volumes	3151
21.2.16. Telemetry access for OpenShift Container Platform	3151
21.2.17. Next steps	3151
21.3. INSTALLING A CLUSTER ON VMC WITH CUSTOMIZATIONS	3152
21.3.1. Setting up VMC for vSphere	3152
21.3.1.1. VMC Sizer tool	3154
21.3.2. vSphere prerequisites	3154
21.3.3. Internet access for OpenShift Container Platform	3155
21.3.4. VMware vSphere infrastructure requirements	3155
21.3.5. Network connectivity requirements	3156
21.3.6. VMware vSphere CSI Driver Operator requirements	3157
21.3.7. vCenter requirements	3158
Required vCenter account privileges	3158
Using OpenShift Container Platform with vMotion	3167
Cluster resources	3167
Cluster limits	3168
Networking requirements	3168
Required IP Addresses	3168
DNS records	3168
21.3.8. Generating a key pair for cluster node SSH access	3169
21.3.9. Obtaining the installation program	3171
21.3.10. Adding vCenter root CA certificates to your system trust	3171
21.3.11. Creating the installation configuration file	3172
21.3.11.1. Installation configuration parameters	3174
21.3.11.1.1. Required configuration parameters	3174
21.3.11.1.2. Network configuration parameters	3175
21.3.11.1.3. Optional configuration parameters	3177
21.3.11.1.4. Additional VMware vSphere configuration parameters	3182
21.3.11.1.5. Optional VMware vSphere machine pool configuration parameters	3183
21.3.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3184
21.3.11.3. Configuring the cluster-wide proxy during installation	3186
21.3.12. Deploying the cluster	3187
21.3.13. Installing the OpenShift CLI by downloading the binary	3189
Installing the OpenShift CLI on Linux	3189
Installing the OpenShift CLI on Windows	3190
Installing the OpenShift CLI on macOS	3190
21.3.14. Logging in to the cluster by using the CLI	3190
21.3.15. Creating registry storage	3191
21.3.15.1. Image registry removed during installation	3191
21.3.15.2. Image registry storage configuration	3191
21.3.15.2.1. Configuring registry storage for VMware vSphere	3191
21.3.15.2.2. Configuring block registry storage for VMware vSphere	3193
21.3.16. Backing up VMware vSphere volumes	3194
21.3.17. Telemetry access for OpenShift Container Platform	3195
21.3.18. Next steps	3195
21.4. INSTALLING A CLUSTER ON VMC WITH NETWORK CUSTOMIZATIONS	3195
21.4.1. Setting up VMC for vSphere	3196
21.4.1.1. VMC Sizer tool	3197
21.4.2. vSphere prerequisites	3198
21.4.3. Internet access for OpenShift Container Platform	3198

21.4.4. VMware vSphere infrastructure requirements	3199
21.4.5. Network connectivity requirements	3200
21.4.6. VMware vSphere CSI Driver Operator requirements	3201
21.4.7. vCenter requirements	3202
Required vCenter account privileges	3202
Using OpenShift Container Platform with vMotion	3211
Cluster resources	3211
Cluster limits	3212
Networking requirements	3212
Required IP Addresses	3212
DNS records	3212
21.4.8. Generating a key pair for cluster node SSH access	3213
21.4.9. Obtaining the installation program	3215
21.4.10. Adding vCenter root CA certificates to your system trust	3215
21.4.11. Creating the installation configuration file	3216
21.4.11.1. Installation configuration parameters	3218
21.4.11.1.1. Required configuration parameters	3218
21.4.11.1.2. Network configuration parameters	3219
21.4.11.1.3. Optional configuration parameters	3221
21.4.11.1.4. Additional VMware vSphere configuration parameters	3226
21.4.11.1.5. Optional VMware vSphere machine pool configuration parameters	3227
21.4.11.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3228
21.4.11.3. Configuring the cluster-wide proxy during installation	3230
21.4.12. Network configuration phases	3231
21.4.13. Specifying advanced network configuration	3232
21.4.14. Cluster Network Operator configuration	3233
21.4.14.1. Cluster Network Operator configuration object	3234
defaultNetwork object configuration	3235
Configuration for the OpenShift SDN CNI cluster network provider	3235
Configuration for the OVN-Kubernetes CNI cluster network provider	3236
kubeProxyConfig object configuration	3238
21.4.15. Deploying the cluster	3239
21.4.16. Installing the OpenShift CLI by downloading the binary	3241
Installing the OpenShift CLI on Linux	3241
Installing the OpenShift CLI on Windows	3241
Installing the OpenShift CLI on macOS	3242
21.4.17. Logging in to the cluster by using the CLI	3242
21.4.18. Creating registry storage	3243
21.4.18.1. Image registry removed during installation	3243
21.4.18.2. Image registry storage configuration	3243
21.4.18.2.1. Configuring registry storage for VMware vSphere	3243
21.4.18.2.2. Configuring block registry storage for VMware vSphere	3245
21.4.19. Backing up VMware vSphere volumes	3246
21.4.20. Telemetry access for OpenShift Container Platform	3246
21.4.21. Next steps	3247
21.5. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK	3247
21.5.1. Setting up VMC for vSphere	3247
21.5.1.1. VMC Sizer tool	3249
21.5.2. vSphere prerequisites	3249
21.5.3. About installations in restricted networks	3250
21.5.3.1. Additional limits	3250
21.5.4. Internet access for OpenShift Container Platform	3250
21.5.5. VMware vSphere infrastructure requirements	3251

21.5.6. Network connectivity requirements	3252
21.5.7. VMware vSphere CSI Driver Operator requirements	3253
21.5.8. vCenter requirements	3254
Required vCenter account privileges	3254
Using OpenShift Container Platform with vMotion	3263
Cluster resources	3263
Cluster limits	3264
Networking requirements	3264
Required IP Addresses	3264
DNS records	3264
21.5.9. Generating a key pair for cluster node SSH access	3265
21.5.10. Adding vCenter root CA certificates to your system trust	3267
21.5.11. Creating the RHCOS image for restricted network installations	3267
21.5.12. Creating the installation configuration file	3268
21.5.12.1. Installation configuration parameters	3271
21.5.12.1.1. Required configuration parameters	3271
21.5.12.1.2. Network configuration parameters	3272
21.5.12.1.3. Optional configuration parameters	3274
21.5.12.1.4. Additional VMware vSphere configuration parameters	3279
21.5.12.1.5. Optional VMware vSphere machine pool configuration parameters	3280
21.5.12.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3281
21.5.12.3. Configuring the cluster-wide proxy during installation	3283
21.5.13. Deploying the cluster	3285
21.5.14. Installing the OpenShift CLI by downloading the binary	3286
Installing the OpenShift CLI on Linux	3287
Installing the OpenShift CLI on Windows	3287
Installing the OpenShift CLI on macOS	3288
21.5.15. Logging in to the cluster by using the CLI	3288
21.5.16. Disabling the default OperatorHub sources	3289
21.5.17. Creating registry storage	3289
21.5.17.1. Image registry removed during installation	3289
21.5.17.2. Image registry storage configuration	3289
21.5.17.2.1. Configuring registry storage for VMware vSphere	3289
21.5.18. Telemetry access for OpenShift Container Platform	3291
21.5.19. Next steps	3291
21.6. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE	3291
21.6.1. Setting up VMC for vSphere	3292
21.6.1.1. VMC Sizer tool	3293
21.6.2. vSphere prerequisites	3294
21.6.3. Internet access for OpenShift Container Platform	3294
21.6.4. VMware vSphere infrastructure requirements	3295
21.6.5. VMware vSphere CSI Driver Operator requirements	3296
21.6.6. Requirements for a cluster with user-provisioned infrastructure	3297
21.6.6.1. Required machines for cluster installation	3297
21.6.6.2. Minimum resource requirements for cluster installation	3297
21.6.6.3. Certificate signing requests management	3298
21.6.6.4. Networking requirements for user-provisioned infrastructure	3298
21.6.6.4.1. Setting the cluster node hostnames through DHCP	3299
21.6.6.4.2. Network connectivity requirements	3299
Ethernet adaptor hardware address requirements	3300
NTP configuration for user-provisioned infrastructure	3301
21.6.6.5. User-provisioned DNS requirements	3301
21.6.6.5.1. Example DNS configuration for user-provisioned clusters	3303

21.6.6.6. Load balancing requirements for user-provisioned infrastructure	3305
21.6.6.6.1. Example load balancer configuration for user-provisioned clusters	3307
21.6.7. Preparing the user-provisioned infrastructure	3308
21.6.8. Validating DNS resolution for user-provisioned infrastructure	3310
21.6.9. Generating a key pair for cluster node SSH access	3313
21.6.10. Obtaining the installation program	3314
21.6.11. Manually creating the installation configuration file	3315
21.6.11.1. Sample install-config.yaml file for VMware vSphere	3316
21.6.11.2. Configuring the cluster-wide proxy during installation	3318
21.6.12. Creating the Kubernetes manifest and Ignition config files	3320
21.6.13. Extracting the infrastructure name	3321
21.6.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	3322
21.6.15. Adding more compute machines to a cluster in vSphere	3326
21.6.16. Disk partitioning	3327
Creating a separate /var partition	3328
21.6.17. Updating the bootloader using bootupd	3330
21.6.18. Installing the OpenShift CLI by downloading the binary	3331
Installing the OpenShift CLI on Linux	3331
Installing the OpenShift CLI on Windows	3332
Installing the OpenShift CLI on macOS	3332
21.6.19. Waiting for the bootstrap process to complete	3333
21.6.20. Logging in to the cluster by using the CLI	3334
21.6.21. Approving the certificate signing requests for your machines	3334
21.6.22. Initial Operator configuration	3337
21.6.22.1. Image registry removed during installation	3338
21.6.22.2. Image registry storage configuration	3338
21.6.22.2.1. Configuring registry storage for VMware vSphere	3338
21.6.22.2.2. Configuring storage for the image registry in non-production clusters	3340
21.6.22.2.3. Configuring block registry storage for VMware vSphere	3341
21.6.23. Completing installation on user-provisioned infrastructure	3342
21.6.24. Backing up VMware vSphere volumes	3344
21.6.25. Telemetry access for OpenShift Container Platform	3345
21.6.26. Next steps	3345
21.7. INSTALLING A CLUSTER ON VMC WITH USER-PROVISIONED INFRASTRUCTURE AND NETWORK CUSTOMIZATIONS	3345
21.7.1. Setting up VMC for vSphere	3345
21.7.1.1. VMC Sizer tool	3347
21.7.2. vSphere prerequisites	3348
21.7.3. Internet access for OpenShift Container Platform	3348
21.7.4. VMware vSphere infrastructure requirements	3348
21.7.5. VMware vSphere CSI Driver Operator requirements	3349
21.7.6. Requirements for a cluster with user-provisioned infrastructure	3350
21.7.6.1. Required machines for cluster installation	3350
21.7.6.2. Minimum resource requirements for cluster installation	3351
21.7.6.3. Certificate signing requests management	3352
21.7.6.4. Networking requirements for user-provisioned infrastructure	3352
21.7.6.4.1. Setting the cluster node hostnames through DHCP	3352
21.7.6.4.2. Network connectivity requirements	3352
Ethernet adaptor hardware address requirements	3354
NTP configuration for user-provisioned infrastructure	3354
21.7.6.5. User-provisioned DNS requirements	3354
21.7.6.5.1. Example DNS configuration for user-provisioned clusters	3356
21.7.6.6. Load balancing requirements for user-provisioned infrastructure	3358

21.7.6.6.1. Example load balancer configuration for user-provisioned clusters	3360
21.7.7. Preparing the user-provisioned infrastructure	3362
21.7.8. Validating DNS resolution for user-provisioned infrastructure	3363
21.7.9. Generating a key pair for cluster node SSH access	3366
21.7.10. Obtaining the installation program	3367
21.7.11. Manually creating the installation configuration file	3368
21.7.11.1. Sample install-config.yaml file for VMware vSphere	3369
21.7.11.2. Configuring the cluster-wide proxy during installation	3371
21.7.12. Specifying advanced network configuration	3373
21.7.13. Cluster Network Operator configuration	3374
21.7.13.1. Cluster Network Operator configuration object	3375
defaultNetwork object configuration	3375
Configuration for the OpenShift SDN CNI cluster network provider	3376
Configuration for the OVN-Kubernetes CNI cluster network provider	3377
kubeProxyConfig object configuration	3379
21.7.14. Creating the Ignition config files	3380
21.7.15. Extracting the infrastructure name	3381
21.7.16. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	3382
21.7.17. Adding more compute machines to a cluster in vSphere	3386
21.7.18. Disk partitioning	3387
Creating a separate /var partition	3388
21.7.19. Updating the bootloader using bootupd	3390
21.7.20. Waiting for the bootstrap process to complete	3391
21.7.21. Logging in to the cluster by using the CLI	3392
21.7.22. Approving the certificate signing requests for your machines	3393
21.7.23. Initial Operator configuration	3395
21.7.23.1. Image registry removed during installation	3396
21.7.23.2. Image registry storage configuration	3396
21.7.23.2.1. Configuring block registry storage for VMware vSphere	3397
21.7.24. Completing installation on user-provisioned infrastructure	3398
21.7.25. Backing up VMware vSphere volumes	3401
21.7.26. Telemetry access for OpenShift Container Platform	3401
21.7.27. Next steps	3401
21.8. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	3401
21.8.1. Setting up VMC for vSphere	3402
21.8.1.1. VMC Sizer tool	3403
21.8.2. vSphere prerequisites	3404
21.8.3. About installations in restricted networks	3404
21.8.3.1. Additional limits	3405
21.8.4. Internet access for OpenShift Container Platform	3405
21.8.5. VMware vSphere infrastructure requirements	3405
21.8.6. VMware vSphere CSI Driver Operator requirements	3407
21.8.7. Requirements for a cluster with user-provisioned infrastructure	3407
21.8.7.1. Required machines for cluster installation	3407
21.8.7.2. Minimum resource requirements for cluster installation	3408
21.8.7.3. Certificate signing requests management	3409
21.8.7.4. Networking requirements for user-provisioned infrastructure	3409
21.8.7.4.1. Setting the cluster node hostnames through DHCP	3409
21.8.7.4.2. Network connectivity requirements	3410
Ethernet adaptor hardware address requirements	3411
NTP configuration for user-provisioned infrastructure	3411
21.8.7.5. User-provisioned DNS requirements	3411

21.8.7.5.1. Example DNS configuration for user-provisioned clusters	3413
21.8.7.6. Load balancing requirements for user-provisioned infrastructure	3415
21.8.7.6.1. Example load balancer configuration for user-provisioned clusters	3417
21.8.8. Preparing the user-provisioned infrastructure	3419
21.8.9. Validating DNS resolution for user-provisioned infrastructure	3421
21.8.10. Generating a key pair for cluster node SSH access	3423
21.8.11. Manually creating the installation configuration file	3425
21.8.11.1. Sample install-config.yaml file for VMware vSphere	3426
21.8.11.2. Configuring the cluster-wide proxy during installation	3428
21.8.12. Creating the Kubernetes manifest and Ignition config files	3430
21.8.13. Extracting the infrastructure name	3432
21.8.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	3432
21.8.15. Adding more compute machines to a cluster in vSphere	3437
21.8.16. Disk partitioning	3437
Creating a separate /var partition	3438
21.8.17. Updating the bootloader using bootupd	3440
21.8.18. Waiting for the bootstrap process to complete	3442
21.8.19. Logging in to the cluster by using the CLI	3442
21.8.20. Approving the certificate signing requests for your machines	3443
21.8.21. Initial Operator configuration	3446
21.8.21.1. Disabling the default OperatorHub sources	3447
21.8.21.2. Image registry storage configuration	3447
21.8.21.2.1. Configuring registry storage for VMware vSphere	3447
21.8.21.2.2. Configuring storage for the image registry in non-production clusters	3449
21.8.21.2.3. Configuring block registry storage for VMware vSphere	3449
21.8.22. Completing installation on user-provisioned infrastructure	3451
21.8.23. Backing up VMware vSphere volumes	3453
21.8.24. Telemetry access for OpenShift Container Platform	3453
21.8.25. Next steps	3454
21.9. UNINSTALLING A CLUSTER ON VMC	3454
21.9.1. Removing a cluster that uses installer-provisioned infrastructure	3454
<b>CHAPTER 22. INSTALLING ON ANY PLATFORM</b> .....	<b>3456</b>
22.1. INSTALLING A CLUSTER ON ANY PLATFORM	3456
22.1.1. Prerequisites	3456
22.1.2. Internet access for OpenShift Container Platform	3456

# CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

## 1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

The OpenShift Container Platform installation program offers you flexibility. You can use the installation program to deploy a cluster on infrastructure that the installation program provisions and the cluster maintains or deploy a cluster on infrastructure that you prepare and maintain.

These two basic types of OpenShift Container Platform clusters are frequently called installer-provisioned infrastructure clusters and user-provisioned infrastructure clusters.

Both types of clusters have the following characteristics:

- Highly available infrastructure with no single points of failure is available by default
- Administrators maintain control over what updates are applied and when

You use the same installation program to deploy both types of clusters. The main assets generated by the installation program are the Ignition config files for the bootstrap, master, and worker machines. With these three configurations and correctly configured infrastructure, you can start an OpenShift Container Platform cluster.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installation. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel. The ultimate target is a running cluster. By meeting dependencies instead of running commands, the installation program is able to recognize and use existing components instead of running the commands to create them again.

The following diagram shows a subset of the installation targets and dependencies:

Figure 1.1. OpenShift Container Platform installation targets and dependencies

After installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. It includes the **kubelet**, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.10 cluster must use RHCOS, which includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure the machines. Operating system updates are delivered as an Atomic OSTree repository that is embedded in a container image that is rolled out across the cluster by an Operator. Actual operating system changes are made in-place on each machine as an atomic operation by using rpm-ostree. Together, these technologies enable OpenShift Container Platform to manage the operating system like it manages any other application on the cluster, via in-place upgrades that keep the entire platform up-to-date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its components and machines, including the operating system. Because of this, only the installation program and the Machine Config Operator can change machines. The installation program uses Ignition config files to set the exact state of each machine, and the Machine Config Operator completes more changes to the machines, such as the application of new certificates or keys, after installation.

### 1.1.1. Installation process

When you install an OpenShift Container Platform cluster, you download the installation program from the appropriate [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. This site manages:

- REST API for accounts
- Registry tokens, which are the pull secrets that you use to obtain the required components

- Cluster registration, which associates the cluster identity to your Red Hat account to facilitate the gathering of usage metrics

In OpenShift Container Platform 4.10, the installation program is a Go binary file that performs a series of file transformations on a set of assets. The way you interact with the installation program differs depending on your installation type.

- For clusters with installer-provisioned infrastructure, you delegate the infrastructure bootstrapping and provisioning to the installation program instead of doing it yourself. The installation program creates all of the networking, machines, and operating systems that are required to support the cluster.
- If you provision and manage the infrastructure for your cluster, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.

You use three sets of files during installation: an installation configuration file that is named **install-config.yaml**, Kubernetes manifests, and Ignition config files for your machine types.

### IMPORTANT

It is possible to modify Kubernetes and the Ignition config files that control the underlying RHCOS operating system during installation. However, no validation is available to confirm the suitability of any modifications that you make to these objects. If you modify these objects, you might render your cluster non-functional. Because of this risk, modifying Kubernetes and Ignition config files is not supported unless you are following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are wrapped into Ignition config files. The installation program uses these Ignition config files to create the cluster.

The installation configuration files are all pruned when you run the installation program, so be sure to back up all configuration files that you want to use again.

### IMPORTANT

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

### The installation process with installer-provisioned infrastructure

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.

If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.

With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

### The installation process with user-provisioned infrastructure

You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself, including:

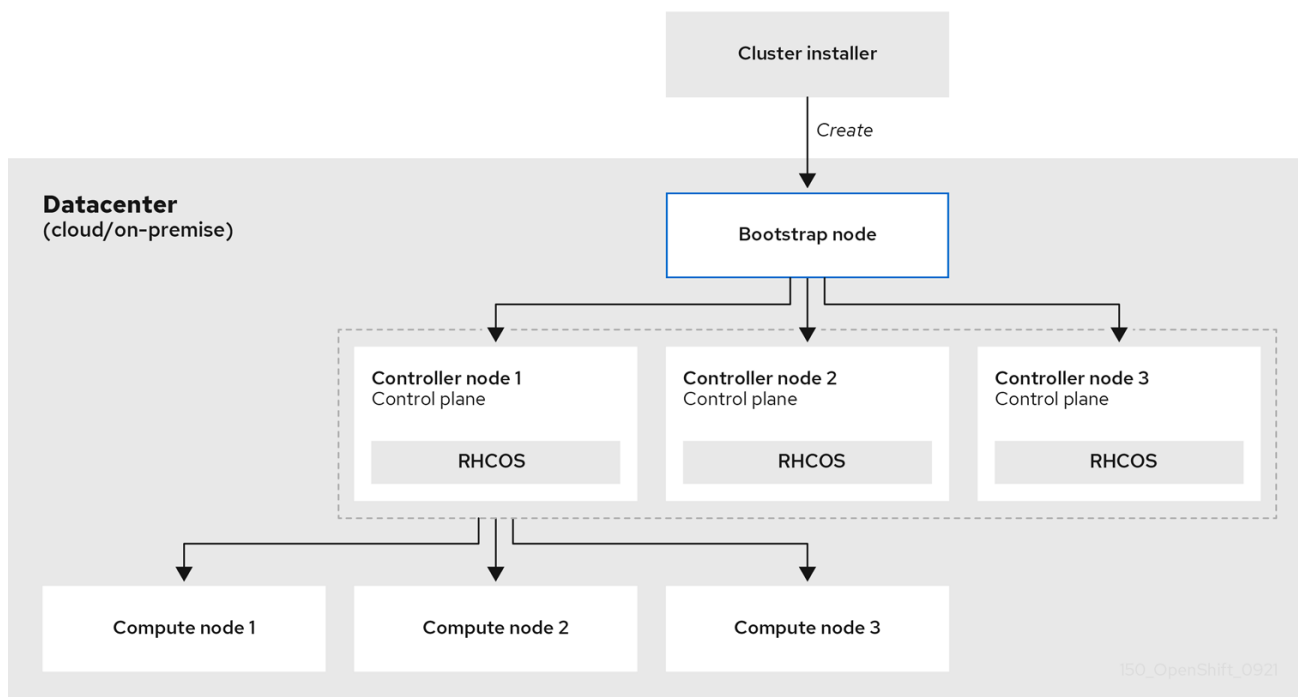

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL compute machines to your cluster.

### Installation process details

Because each machine in the cluster requires information about the cluster when it is provisioned, OpenShift Container Platform uses a temporary *bootstrap* machine during initial configuration to provide the required information to the permanent control plane. It boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:

Figure 1.2. Creating the bootstrap, control plane, and compute machines

150\_OpenShift\_0921

After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. (Requires manual intervention if you provision the infrastructure)
2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.
3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. (Requires manual intervention if you provision the infrastructure)
4. The temporary control plane schedules the production control plane to the production control plane machines.
5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.
6. The temporary control plane shuts down and passes control to the production control plane.
7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.
8. The installation program shuts down the bootstrap machine. (Requires manual intervention if you provision the infrastructure)
9. The control plane sets up the compute nodes.
10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operation, including the creation of compute machines in supported environments.

### 1.1.2. Verifying node state after installation

The OpenShift Container Platform installation completes when the following installation health checks are successful:

- The provisioner can access the OpenShift Container Platform web console.
- All control plane nodes are ready.
- All cluster Operators are available.

## NOTE

After the installation completes, the specific cluster Operators responsible for the worker nodes continuously attempt to provision all worker nodes. It can take some time before all worker nodes report as **READY**. For installations on bare metal, wait a minimum of 60 minutes before troubleshooting a worker node. For installations on all other platforms, wait a minimum of 40 minutes before troubleshooting a worker node. A **DEGRADED** state for the cluster Operators responsible for the worker nodes depends on the Operators' own resources and not on the state of the nodes.

After your installation completes, you can continue to monitor the condition of the nodes in your cluster by using the following steps.

## Prerequisites

- The installation program resolves successfully in the terminal.

## Procedure

1. Show the status of all worker nodes:

```
$ oc get nodes
```

### Example output

NAME	STATUS	ROLES	AGE	VERSION
example-compute1.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute2.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute4.example.com	Ready	worker	14m	v1.21.6+bb8d50a
example-control1.example.com	Ready	master	52m	v1.21.6+bb8d50a
example-control2.example.com	Ready	master	55m	v1.21.6+bb8d50a
example-control3.example.com	Ready	master	55m	v1.21.6+bb8d50a

2. Show the phase of all worker machine nodes:

```
$ oc get machines -A
```

### Example output

NAMESPACE	NAME	PHASE	TYPE	REGION	ZONE	AGE
openshift-machine-api	example-zbbt6-master-0	Running				95m
openshift-machine-api	example-zbbt6-master-1	Running				95m
openshift-machine-api	example-zbbt6-master-2	Running				95m
openshift-machine-api	example-zbbt6-worker-0-25bhp	Running				49m

openshift-machine-api	example-zbbt6-worker-0-8b4c2	Running	49m
openshift-machine-api	example-zbbt6-worker-0-jkbqt	Running	49m
openshift-machine-api	example-zbbt6-worker-0-qrl5b	Running	49m

### Additional resources

- [Getting the BareMetalHost resource](#)
- [Following the installation](#)
- [Validating an installation](#)

### Installation scope

The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

### Additional resources

- See [Available cluster customizations](#) for details about OpenShift Container Platform configuration resources.

## 1.1.3. OpenShift Local overview

OpenShift Local supports rapid application development to get started building OpenShift Container Platform clusters. OpenShift Local is designed to run on a local computer to simplify setup and testing, and to emulate the cloud development environment locally with all of the tools needed to develop container-based applications.

Regardless of the programming language you use, OpenShift Local hosts your application and brings a minimal, preconfigured Red Hat OpenShift Container Platform cluster to your local PC without the need for a server-based infrastructure.

On a hosted environment, OpenShift Local can create microservices, convert them into images, and run them in Kubernetes-hosted containers directly on your laptop or desktop running Linux, macOS, or Windows 10 or later.

For more information about OpenShift Local, see [Red Hat OpenShift Local Overview](#).

## 1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS

In OpenShift Container Platform 4.10, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Amazon Web Services (AWS)
- Google Cloud Platform (GCP)
- Microsoft Azure
- Microsoft Azure Stack Hub
- Red Hat OpenStack Platform (RHOSP) versions 16.1 and 16.2

- The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the [OpenShift Container Platform on RHOSP support matrix](#).
- IBM Cloud VPC
- Red Hat Virtualization (RHV)
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Alibaba Cloud
- Bare metal

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

### IMPORTANT

After installation, the following changes are not supported:

- Mixing cloud provider platforms
- Mixing cloud provider components, such as using a persistent storage framework from a differing platform than what the cluster is installed on

In OpenShift Container Platform 4.10, you can install a cluster that uses user-provisioned infrastructure on the following platforms:

- AWS
- Azure
- Azure Stack Hub
- GCP
- RHOSP versions 16.1 and 16.2
- RHV
- VMware vSphere
- VMware Cloud on AWS
- Bare metal
- IBM Z or LinuxONE
- IBM Power

Depending on the supported cases for the platform, installations on user-provisioned infrastructure allow you to run machines with full internet access, place your cluster behind a proxy, or perform a *restricted network installation*. In a restricted network installation, you can download the images that are

required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a restricted network installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The [OpenShift Container Platform 4.x Tested Integrations](#) page contains details about integration testing for different platforms.

### Additional resources

- See [Supported installation methods for different platforms](#) for more information about the types of installations that are available for each supported platform.
- See [Selecting a cluster installation method and preparing it for users](#) for information about choosing an installation method and preparing the required resources.

## CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and make sure you that you have all of the required resources to prepare the cluster for users.

### 2.1. SELECTING A CLUSTER INSTALLATION TYPE

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

#### 2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Alibaba Cloud
- Amazon Web Services (AWS) on 64-bit x86 instances
- Amazon Web Services (AWS) on 64-bit ARM instances
- Microsoft Azure
- Microsoft Azure Stack Hub
- Google Cloud Platform (GCP)
- Red Hat OpenStack Platform (RHOSP)
- Red Hat Virtualization (RHV)
- IBM Cloud VPC
- IBM Z and LinuxONE
- IBM Z and LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same datacenter or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use [OpenShift Dedicated](#) or [OpenShift Online](#). You can also use OpenShift as a managed service on Azure,

AWS, IBM Cloud VPC, or Google Cloud. For more information about managed services, see the [OpenShift Products](#) page. If you install an OpenShift Container Platform cluster with a cloud virtual machine as a virtual bare metal, the corresponding cloud-based storage is not supported.

### 2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves the Operators that package, deploy, and manage Kubernetes applications and the operating system that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines as part of the installation process for OpenShift Container Platform. See [Differences between OpenShift Container Platform 3 and 4](#).

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see [Migrating from OpenShift Container Platform 3 to 4 overview](#). Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

### 2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called *installer provisioned infrastructure* installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to [Alibaba Cloud](#), [AWS](#), [Azure](#), [Azure Stack Hub](#), [GCP](#), or [VMC on AWS](#). These installation methods are the fastest way to deploy a production-capable OpenShift Container Platform cluster.

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for [Alibaba Cloud](#), [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#).

For installer-provisioned infrastructure installations, you can use an existing [VPC in AWS](#), [vNet in Azure](#), or [VPC in GCP](#). You can also reuse part of your networking infrastructure so that your cluster in [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#) can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for [RHOSP](#), [RHOSP with Kuryr](#), [RHOSP on SR-IOV](#), [RHV](#), [vSphere](#), and [bare metal](#). Additionally, for [vSphere](#), [VMC on AWS](#), you can also customize additional network parameters during installation.

If you want to reuse extensive cloud infrastructure, you can complete a *user-provisioned infrastructure* installation. With these installations, you manually deploy the machines that your cluster requires during the installation process. If you perform a user-provisioned infrastructure installation on [AWS](#), [Azure](#),

[Azure Stack Hub](#), [GCP](#), or [VMC on AWS](#), you can use the provided templates to help you stand up all of the required components. You can also reuse a shared [VPC on GCP](#). Otherwise, you can use the [provider-agnostic](#) installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you use [RHOSP](#), [RHOSP on SR-IOV](#), [RHV](#), [IBM Z or LinuxONE](#), [IBM Z or LinuxONE with RHEL KVM](#), [IBM Power](#), or [vSphere](#), use the specific installation instructions to deploy your cluster. If you use other supported hardware, follow the [bare metal installation](#) procedure. For some of these platforms, such as [RHOSP](#), [vSphere](#), [VMC on AWS](#), and [bare metal](#), you can also customize additional network parameters during installation.

### 2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The instructions are included in each installation procedure.

If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy a private cluster with installer-provisioned infrastructure on [AWS](#), [Azure](#), or [GCP](#).

If you need to install your cluster that has limited access to the internet, such as a disconnected or restricted network cluster, you can [mirror the installation packages](#) and install the cluster from them. Follow detailed instructions for user provisioned infrastructure installations into restricted networks for [AWS](#), [GCP](#), [IBM Z or LinuxONE](#), [IBM Z or LinuxONE with RHEL KVM](#), [IBM Power](#), [vSphere](#), [VMC on AWS](#), or [bare metal](#). You can also install a cluster into a restricted network using installer-provisioned infrastructure by following detailed instructions for [AWS](#), [GCP](#), [VMC on AWS](#), [RHOSP](#), [RHV](#), and [vSphere](#).

If you need to deploy your cluster to an [AWS GovCloud region](#), [AWS China region](#), or [Azure government region](#), you can configure those custom regions during an installer-provisioned infrastructure installation.

You can also configure the cluster machines to use [FIPS Validated / Modules in Process cryptographic libraries](#) during installation.

#### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

## 2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION

Some configuration is not required to install the cluster but recommended before your users access the cluster. You can customize the cluster itself by [customizing](#) the Operators that make up your cluster and integrate your cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- [Persistent storage](#)
- [An identity provider](#)
- [Monitoring core OpenShift Container Platform components](#)

## 2.3. PREPARING YOUR CLUSTER FOR WORKLOADS

Depending on your workload needs, you might need to take extra steps before you begin deploying applications. For example, after you prepare infrastructure to support your application [build strategy](#), you might need to make provisions for [low-latency](#) workloads or to [protect sensitive workloads](#). You can also configure [monitoring](#) for application workloads.

If you plan to run [Windows workloads](#), you must enable [hybrid networking with OVN-Kubernetes](#) during the installation process; hybrid networking cannot be enabled after your cluster is installed.

## 2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS

You can perform different types of installations on different platforms.

### NOTE

Not all installation options are supported for all platforms, as shown in the following tables. A checkmark indicates that the option is supported and links to the relevant section.

Table 2.1. Installer-provisioned infrastructure options

	Alibaba	AWS (64-bit x86_64)	AWS (ARM)	Azure	Azure Stack Hub	Google Cloud Platform	RHEL OS P	RHEL OS P SR - IOV	RHEL V	Baremetal	vSphere	VMC	IBM Cloud VPC	IBM Z	IBM Power
Default	✓	✓	✓	✓	✓	✓			✓	✓	✓	✓	✓

Restricted network		✓			✓			✓	✓		✓	✓		✓	✓	✓	
Shared VPC hosted outside of cluster project					✓												

## CHAPTER 3. DISCONNECTED INSTALLATION MIRRORING

### 3.1. ABOUT DISCONNECTED INSTALLATION MIRRORING

You can use a mirror registry to ensure that your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

#### 3.1.1. Creating a mirror registry

If you already have a container image registry, such as Red Hat Quay, you can use it as your mirror registry. If you do not already have a registry, you can [create a mirror registry using the \*mirror registry for Red Hat OpenShift\*](#).

#### 3.1.2. Mirroring images for a disconnected installation

You can use one of the following procedures to mirror your OpenShift Container Platform image repository to your mirror registry:

- [Mirroring images for a disconnected installation](#)
- [Mirroring images for a disconnected installation using the \*oc-mirror\* plugin](#) (Technology Preview)

### 3.2. CREATING A MIRROR REGISTRY WITH MIRROR REGISTRY FOR RED HAT OPENSIFT

The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

If you already have a container image registry, such as Red Hat Quay, you can skip this section and go straight to [Mirroring the OpenShift Container Platform image repository](#).

#### 3.2.1. Prerequisites

- An OpenShift Container Platform subscription.
- Red Hat Enterprise Linux (RHEL) 8 and 9 with Podman 3.3 and OpenSSL installed.
- Fully qualified domain name for the Red Hat Quay service, which must resolve through a DNS server.
- Key-based SSH connectivity on the target host. SSH keys are automatically generated for local installs. For remote hosts, you must generate your own SSH keys.
- 2 or more vCPUs.
- 8 GB of RAM.
- About 12 GB for OpenShift Container Platform 4.10 release images, or about 358 GB for OpenShift Container Platform 4.10 release images and OpenShift Container Platform 4.10 Red Hat Operator images. Up to 1 TB per stream or more is suggested.

## IMPORTANT

These requirements are based on local testing results with only release images and Operator images. Storage requirements can vary based on your organization's needs. You might require more space, for example, when you mirror multiple z-streams. You can use standard [Red Hat Quay functionality](#) or the proper [API callout](#) to remove unnecessary images and free up space.

### 3.2.2. Mirror registry for Red Hat OpenShift introduction

For disconnected deployments of OpenShift Container Platform, a container registry is required to carry out the installation of the clusters. To run a production-grade registry service on such a cluster, you must create a separate registry deployment to install the first cluster. The *mirror registry for Red Hat OpenShift* addresses this need and is included in every OpenShift subscription. It is available for download on the [OpenShift console Downloads](#) page.

The *mirror registry for Red Hat OpenShift* allows users to install a small-scale version of Red Hat Quay and its required components using the **mirror-registry** command line interface (CLI) tool. The *mirror registry for Red Hat OpenShift* is deployed automatically with pre-configured local storage and a local database. It also includes auto-generated user credentials and access permissions with a single set of inputs and no additional configuration choices to get started.

The *mirror registry for Red Hat OpenShift* provides a pre-determined network configuration and reports deployed component credentials and access URLs upon success. A limited set of optional configuration inputs like fully qualified domain name (FQDN) services, superuser name and password, and custom TLS certificates are also provided. This provides users with a container registry so that they can easily create an offline mirror of all OpenShift Container Platform release content when running OpenShift Container Platform in restricted network environments.

The *mirror registry for Red Hat OpenShift* is limited to hosting images that are required to install a disconnected OpenShift Container Platform cluster, such as Release images or Red Hat Operator images. It uses local storage on your Red Hat Enterprise Linux (RHEL) machine, and storage supported by RHEL is supported by the *mirror registry for Red Hat OpenShift*. Content built by customers should not be hosted by the *mirror registry for Red Hat OpenShift*.

Unlike Red Hat Quay, the *mirror registry for Red Hat OpenShift* is not a highly-available registry and only local file system storage is supported. Using the *mirror registry for Red Hat OpenShift* with more than one cluster is discouraged, because multiple clusters can create a single point of failure when updating your cluster fleet. It is advised to leverage the *mirror registry for Red Hat OpenShift* to install a cluster that can host a production-grade, highly-available registry such as Red Hat Quay, which can serve OpenShift Container Platform content to other clusters.

Use of the *mirror registry for Red Hat OpenShift* is optional if another container registry is already available in the install environment.

### 3.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a local host using the **mirror-registry** installer tool. By doing so, users can create a local host registry running on port 443 for the purpose of storing a mirror of OpenShift Container Platform images.

**NOTE**

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **\$HOME/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

**Procedure**

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ ./mirror-registry install \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the registry by running the following command:

```
$ podman login -u init \
  -p <password> \
  <host_example_com>:8443> \
  --tls-verify=false 1
```

- 1 You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

**NOTE**

You can also log in by accessing the UI at **https://<host.example.com>:8443** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

**3.2.4. Updating mirror registry for Red Hat OpenShift from a local host**

This procedure explains how to update the *mirror registry for Red Hat OpenShift* from a local host using the **upgrade** command. Updating to the latest version ensures new features, bug fixes, and security vulnerability fixes.

## IMPORTANT

When updating, there is intermittent downtime of your mirror registry, as it is restarted during the update process.

### Prerequisites

- You have installed the *mirror registry for Red Hat OpenShift* on a local host.

### Procedure

- If you are upgrading the *mirror registry for Red Hat OpenShift* from 1.2.z → 1.3.0, and your installation directory is the default at **/etc/quay-install**, you can enter the following command:

```
$ sudo ./mirror-registry upgrade -v
```

## NOTE

- *mirror registry for Red Hat OpenShift* migrates Podman volumes for Quay storage, Postgres data, and **/etc/quay-install** data to the new **\$HOME/quay-install** location. This allows you to use *mirror registry for Red Hat OpenShift* without the **--quayRoot** flag during future upgrades.
- Users who upgrade *mirror registry for Red Hat OpenShift* with the **./mirror-registry upgrade -v** flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayHostname <host\_example\_com>** and **--quayRoot <example\_directory\_name>**, you must include that string to properly upgrade the mirror registry.
- If you are upgrading the *mirror registry for Red Hat OpenShift* from 1.2.z → 1.3.0 and you used a specified directory in your 1.2.z deployment, you must pass in the new **--pgStorage** and **--quayStorage** flags. For example:

```
$ sudo ./mirror-registry upgrade --quayHostname <host_example_com> --quayRoot
<example_directory_name> --pgStorage <example_directory_name>/pg-data --quayStorage
<example_directory_name>/quay-storage -v
```

### 3.2.5. Mirroring on a remote host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a remote host using the **mirror-registry** tool. By doing so, users can create a registry to hold a mirror of OpenShift Container Platform images.

**NOTE**

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **\$HOME/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

**Procedure**

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ ./mirror-registry install -v \
  --targetHostname <host_example_com> \
  --targetUsername <example_user> \
  -k ~/.ssh/my_ssh_key \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the mirror registry by running the following command:

```
$ podman login -u init \
  -p <password> \
  <host_example_com>:8443 \
  --tls-verify=false 1
```

- 1** You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

**NOTE**

You can also log in by accessing the UI at **https://<host.example.com>:8443** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

### 3.2.6. Updating mirror registry for Red Hat OpenShift from a remote host

This procedure explains how to update the *mirror registry for Red Hat OpenShift* from a remote host using the **upgrade** command. Updating to the latest version ensures bug fixes and security vulnerability fixes.

#### IMPORTANT

When updating, there is intermittent downtime of your mirror registry, as it is restarted during the update process.

#### Prerequisites

- You have installed the *mirror registry for Red Hat OpenShift* on a remote host.

#### Procedure

- To upgrade the *mirror registry for Red Hat OpenShift* from a remote host, enter the following command:

```
$ ./mirror-registry upgrade -v --targetHostname <remote_host_url> --targetUsername
<user_name> -k ~/.ssh/my_ssh_key
```

#### NOTE

Users who upgrade the *mirror registry for Red Hat OpenShift* with the **./mirror-registry upgrade -v** flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayHostname <host\_example\_com>** and **--quayRoot <example\_directory\_name>**, you must include that string to properly upgrade the mirror registry.

### 3.2.7. Uninstalling the mirror registry for Red Hat OpenShift

- You can uninstall the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

```
$ ./mirror-registry uninstall -v \
--quayRoot <example_directory_name>
```

#### NOTE

- Deleting the *mirror registry for Red Hat OpenShift* will prompt the user before deletion. You can use **--autoApprove** to skip this prompt.
- Users who install the *mirror registry for Red Hat OpenShift* with the **--quayRoot** flag must include the **--quayRoot** flag when uninstalling. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayRoot example\_directory\_name**, you must include that string to properly uninstall the mirror registry.

### 3.2.8. Mirror registry for Red Hat OpenShift flags

The following flags are available for the *mirror registry for Red Hat OpenShift*:

Flags	Description
<b>--autoApprove</b>	A boolean value that disables interactive prompts. If set to <b>true</b> , the <b>quayRoot</b> directory is automatically deleted when uninstalling the mirror registry. Defaults to <b>false</b> if left unspecified.
<b>--initPassword</b>	The password of the init user created during Quay installation. Must be at least eight characters and contain no whitespace.
<b>--initUser string</b>	Shows the username of the initial user. Defaults to <b>init</b> if left unspecified.
<b>--no-color, -c</b>	Allows users to disable color sequences and propagate that to Ansible when running install, uninstall, and upgrade commands.
<b>--pgStorage</b>	The folder where Postgres persistent storage data is saved. Defaults to the <b>pg-storage</b> Podman volume. Root privileges are required to uninstall.
<b>--quayHostname</b>	The fully-qualified domain name of the mirror registry that clients will use to contact the registry. Equivalent to <b>SERVER_HOSTNAME</b> in the Quay <b>config.yaml</b> . Must resolve by DNS. Defaults to <b>&lt;targetHostname&gt;:8443</b> if left unspecified. <sup>[1]</sup>
<b>--quayStorage</b>	The folder where Quay persistent storage data is saved. Defaults to the <b>quay-storage</b> Podman volume. Root privileges are required to uninstall.
<b>--quayRoot, -r</b>	The directory where container image layer and configuration data is saved, including <b>rootCA.key</b> , <b>rootCA.pem</b> , and <b>rootCA.srl</b> certificates. Defaults to <b>\$HOME/quay-install</b> if left unspecified.
<b>--ssh-key, -k</b>	The path of your SSH identity key. Defaults to <b>~/.ssh/quay_installer</b> if left unspecified.
<b>--sslCert</b>	The path to the SSL/TLS public key / certificate. Defaults to <b>{quayRoot}/quay-config</b> and is auto-generated if left unspecified.
<b>--sslCheckSkip</b>	Skips the check for the certificate hostname against the <b>SERVER_HOSTNAME</b> in the <b>config.yaml</b> file. <sup>[2]</sup>
<b>--sslKey</b>	The path to the SSL/TLS private key used for HTTPS communication. Defaults to <b>{quayRoot}/quay-config</b> and is auto-generated if left unspecified.
<b>--targetHostname, -H</b>	The hostname of the target you want to install Quay to. Defaults to <b>\$HOST</b> , for example, a local host, if left unspecified.
<b>--targetUsername, -u</b>	The user on the target host which will be used for SSH. Defaults to <b>\$USER</b> , for example, the current user if left unspecified.

Flags	Description
<b>--verbose, -v</b>	Shows debug logs and Ansible playbook outputs.
<b>--version</b>	Shows the version for the <i>mirror registry for Red Hat OpenShift</i>

1. **--quayHostname** must be modified if the public DNS name of your system is different from the local hostname. Additionally, the **--quayHostname** flag does not support installation with an IP address. Installation with a hostname is required.
2. **--sslCheckSkip** is used in cases when the mirror registry is set behind a proxy and the exposed hostname is different from the internal Quay hostname. It can also be used when users do not want the certificates to be validated against the provided Quay hostname during installation.

### 3.2.9. Mirror registry for Red Hat OpenShift release notes

The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

These release notes track the development of the *mirror registry for Red Hat OpenShift* in OpenShift Container Platform.

For an overview of the *mirror registry for Red Hat OpenShift*, see [Creating a mirror registry with mirror registry for Red Hat OpenShift](#).

#### 3.2.9.1. Mirror registry for Red Hat OpenShift 1.3.8

Issued: 2023-08-16

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.11.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:4622 - mirror registry for Red Hat OpenShift 1.3.8](#)

#### 3.2.9.2. Mirror registry for Red Hat OpenShift 1.3.7

Issued: 2023-07-19

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.10.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:4087 - mirror registry for Red Hat OpenShift 1.3.7](#)

#### 3.2.9.3. Mirror registry for Red Hat OpenShift 1.3.6

Issued: 2023-05-30

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.8.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:3302 - mirror registry for Red Hat OpenShift 1.3.6](#)

#### 3.2.9.4. Mirror registry for Red Hat OpenShift 1.3.5

Issued: 2023-05-18

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.7.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:3225 - mirror registry for Red Hat OpenShift 1.3.5](#)

#### 3.2.9.5. Mirror registry for Red Hat OpenShift 1.3.4

Issued: 2023-04-25

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.6.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1914 - mirror registry for Red Hat OpenShift 1.3.4](#)

#### 3.2.9.6. Mirror registry for Red Hat OpenShift 1.3.3

Issued: 2023-04-05

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.5.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1528 - mirror registry for Red Hat OpenShift 1.3.3](#)

#### 3.2.9.7. Mirror registry for Red Hat OpenShift 1.3.2

Issued: 2023-03-21

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.4.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1376 - mirror registry for Red Hat OpenShift 1.3.2](#)

#### 3.2.9.8. Mirror registry for Red Hat OpenShift 1.3.1

Issued: 2023-03-7

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.3.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1086 - mirror registry for Red Hat OpenShift 1.3.1](#)

#### 3.2.9.9. Mirror registry for Red Hat OpenShift 1.3.0

Issued: 2023-02-20

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.8.1.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:0558 - mirror registry for Red Hat OpenShift 1.3.0](#)

### 3.2.9.9.1. New features

- *Mirror registry for Red Hat OpenShift* is now supported on Red Hat Enterprise Linux (RHEL) 9 installations.
- IPv6 support is now available on *mirror registry for Red Hat OpenShift* local host installations. IPv6 is currently unsupported on *mirror registry for Red Hat OpenShift* remote host installations.
- A new feature flag, **--quayStorage**, has been added. With this flag, users with root privileges can manually set the location of their Quay persistent storage.
- A new feature flag, **--pgStorage**, has been added. With this flag, users with root privileges can manually set the location of their Postgres persistent storage.
- Previously, users were required to have root privileges (**sudo**) to install *mirror registry for Red Hat OpenShift*. With this update, **sudo** is no longer required to install *mirror registry for Red Hat OpenShift*.

When *mirror registry for Red Hat OpenShift* was installed with **sudo**, an `/etc/quay-install` directory that contained installation files, local storage, and the configuration bundle was created. With the removal of the **sudo** requirement, installation files and the configuration bundle are now installed to `$HOME/quay-install`. Local storage, for example Postgres and Quay, are now stored in named volumes automatically created by Podman.

To override the default directories that these files are stored in, you can use the command line arguments for *mirror registry for Red Hat OpenShift*. For more information about *mirror registry for Red Hat OpenShift* command line arguments, see "*Mirror registry for Red Hat OpenShift flags*".

### 3.2.9.9.2. Bug fixes

- Previously, the following error could be returned when attempting to uninstall *mirror registry for Red Hat OpenShift*: `["Error: no container with name or ID \"quay-postgres\" found: no such container"], "stdout": "", "stdout_lines": []`. With this update, the order that *mirror registry for Red Hat OpenShift* services are stopped and uninstalled have been changed so that the error no longer occurs when uninstalling *mirror registry for Red Hat OpenShift*. For more information, see [PROJQUAY-4629](#).

### 3.2.9.10. Mirror registry for Red Hat OpenShift 1.2.9

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.10.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:7369 - mirror registry for Red Hat OpenShift 1.2.9](#)

### 3.2.9.11. Mirror registry for Red Hat OpenShift 1.2.8

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.9.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:7065 - mirror registry for Red Hat OpenShift 1.2.8](#)

### 3.2.9.12. Mirror registry for Red Hat OpenShift 1.2.7

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.8.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:6500 - mirror registry for Red Hat OpenShift 1.2.7](#)

#### 3.2.9.12.1. Bug fixes

- Previously, **getFQDN()** relied on the fully-qualified domain name (FQDN) library to determine its FQDN, and the FQDN library tried to read the **/etc/hosts** folder directly. Consequently, on some Red Hat Enterprise Linux CoreOS (RHCOS) installations with uncommon DNS configurations, the FQDN library would fail to install and abort the installation. With this update, *mirror registry for Red Hat OpenShift* uses **hostname** to determine the FQDN. As a result, the FQDN library does not fail to install. ([PROJQUAY-4139](#))

### 3.2.9.13. Mirror registry for Red Hat OpenShift 1.2.6

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.7.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:6278 - mirror registry for Red Hat OpenShift 1.2.6](#)

#### 3.2.9.13.1. New features

A new feature flag, **--no-color (-c)** has been added. This feature flag allows users to disable color sequences and propagate that to Ansible when running `install`, `uninstall`, and `upgrade` commands.

### 3.2.9.14. Mirror registry for Red Hat OpenShift 1.2.5

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.6.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:6071 - mirror registry for Red Hat OpenShift 1.2.5](#)

### 3.2.9.15. Mirror registry for Red Hat OpenShift 1.2.4

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.5.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:5884 - mirror registry for Red Hat OpenShift 1.2.4](#)

### 3.2.9.16. Mirror registry for Red Hat OpenShift 1.2.3

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.4.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:5649 - mirror registry for Red Hat OpenShift 1.2.3](#)

### 3.2.9.17. Mirror registry for Red Hat OpenShift 1.2.2

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.3.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:5501 - mirror registry for Red Hat OpenShift 1.2.2](#)

### 3.2.9.18. Mirror registry for Red Hat OpenShift 1.2.1

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.2.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:4986 - mirror registry for Red Hat OpenShift 1.2.1](#)

### 3.2.9.19. Mirror registry for Red Hat OpenShift 1.2.0

*Mirror registry for Red Hat OpenShift* is now available with Red Hat Quay 3.7.1.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:4986 - mirror registry for Red Hat OpenShift 1.2.0](#)

#### 3.2.9.19.1. Bug fixes

- Previously, all components and workers running inside of the Quay pod Operator had log levels set to **DEBUG**. As a result, large traffic logs were created that consumed unnecessary space. With this update, log levels are set to **WARN** by default, which reduces traffic information while emphasizing problem scenarios. ([PROJQUAY-3504](#))

### 3.2.9.20. Mirror registry for Red Hat OpenShift 1.1.0

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:0956 - mirror registry for Red Hat OpenShift 1.1.0](#)

#### 3.2.9.20.1. New features

- A new command, **mirror-registry upgrade** has been added. This command upgrades all container images without interfering with configurations or data.

#### NOTE

If **quayRoot** was previously set to something other than default, it must be passed into the upgrade command.

#### 3.2.9.20.2. Bug fixes

- Previously, the absence of **quayHostname** or **targetHostname** did not default to the local hostname. With this update, **quayHostname** and **targetHostname** now default to the local hostname if they are missing. ([PROJQUAY-3079](#))

- Previously, the command `./mirror-registry --version` returned an **unknown flag** error. Now, running `./mirror-registry --version` returns the current version of the *mirror registry for Red Hat OpenShift*. ([PROJQUAY-3086](#))
- Previously, users could not set a password during installation, for example, when running `./mirror-registry install --initUser <user_name> --initPassword <password> --verbose`. With this update, users can set a password during installation. ([PROJQUAY-3149](#))
- Previously, the *mirror registry for Red Hat OpenShift* did not recreate pods if they were destroyed. Now, pods are recreated if they are destroyed. ([PROJQUAY-3261](#))

### 3.2.10. Troubleshooting mirror registry for Red Hat OpenShift

To assist in troubleshooting *mirror registry for Red Hat OpenShift*, you can gather logs of systemd services installed by the mirror registry. The following services are installed:

- `quay-app.service`
- `quay-postgres.service`
- `quay-redis.service`
- `quay-pod.service`

#### Prerequisites

- You have installed *mirror registry for Red Hat OpenShift*.

#### Procedure

- If you installed *mirror registry for Red Hat OpenShift* with root privileges, you can get the status information of its systemd services by entering the following command:

```
$ sudo systemctl status <service>
```

- If you installed *mirror registry for Red Hat OpenShift* as a standard user, you can get the status information of its systemd services by entering the following command:

```
$ systemctl --user status <service>
```

#### Additional resources

- [Configuring the system to trust the certificate authority](#)
- [Mirroring the OpenShift Container Platform image repository](#)
- [Mirroring Operator catalogs for use with disconnected clusters](#)

## 3.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

You can ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you

must have a registry for mirroring.

### IMPORTANT

You must have access to the internet to obtain the necessary container images. In this procedure, you place your mirror registry on a mirror host that has access to both your network and the internet. If you do not have access to a mirror host, use the [Mirroring Operator catalogs for use with disconnected clusters](#) procedure to copy images to a device you can move across network boundaries with.

#### 3.3.1. Prerequisites

- You must have a container image registry that supports [Docker v2-2](#) in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
  - [Red Hat Quay](#)
  - [JFrog Artifactory](#)
  - [Sonatype Nexus Repository](#)
  - [Harbor](#)

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay [for proof-of-concept purposes](#) or [by using the Quay Operator](#). If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat support.

- If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a [mirror registry for Red Hat OpenShift](#). The *mirror registry for Red Hat OpenShift* is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

#### 3.3.2. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry such as Red Hat Quay, JFrog Artifactory, Sonatype Nexus Repository, or Harbor. If you do not have access to a large-scale container registry, you can use the *mirror registry for Red Hat OpenShift*, a small-scale container registry included with OpenShift Container Platform subscriptions.

You can use any container registry that supports [Docker v2-2](#), such as Red Hat Quay, the *mirror registry for Red Hat OpenShift*, Artifactory, Sonatype Nexus Repository, or Harbor. Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

### IMPORTANT

The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the *mirror registry for Red Hat OpenShift*, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror

registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the **crictl images** command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

#### NOTE

Red Hat does not test third party registries with OpenShift Container Platform.

### Additional information

For information about viewing the CRI-O logs to view the image source, see [Viewing the image pull source](#).

### 3.3.3. Preparing your mirror host

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.

#### 3.3.3.1. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 3.3.4. Configuring credentials that allow images to be mirrored

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

#### WARNING

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

#### WARNING

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

#### Prerequisites

- You configured a mirror registry to use in your disconnected environment.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

#### Procedure

Complete the following steps on the installation host:

1. Download your **registry.redhat.io** [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Make a copy of your pull secret in JSON format:

```
$ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json> 1
```

- 1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

The contents of the file resemble the following example:

```
{
  "auths": {
```

```

"cloud.openshift.com": {
  "auth": "b3BlbnNo...",
  "email": "you@example.com"
},
"quay.io": {
  "auth": "b3BlbnNo...",
  "email": "you@example.com"
},
"registry.connect.redhat.com": {
  "auth": "NTE3Njg5Nj...",
  "email": "you@example.com"
},
"registry.redhat.io": {
  "auth": "NTE3Njg5Nj...",
  "email": "you@example.com"
}
}
}

```

3. Generate the base64-encoded user name and password or token for your mirror registry:

```

$ echo -n '<user_name>:<password>' | base64 -w0 1
BGVtbYk3ZHAAtqXs=

```

- 1 For **<user\_name>** and **<password>**, specify the user name and password that you configured for your registry.

4. Edit the JSON file and add a section that describes your registry to it:

```

"auths": {
  "<mirror_registry>": { 1
    "auth": "<credentials>", 2
    "email": "you@example.com"
  }
},

```

- 1 For **<mirror\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:8443**
- 2 For **<credentials>**, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```

{
  "auths": {
    "registry.example.com": {
      "auth": "BGVtbYk3ZHAAtqXs=",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",

```

```

    "email": "you@example.com"
  },
  "quay.io": {
    "auth": "b3BlbnNo...",
    "email": "you@example.com"
  },
  "registry.connect.redhat.com": {
    "auth": "NTE3Njg5Nj...",
    "email": "you@example.com"
  },
  "registry.redhat.io": {
    "auth": "NTE3Njg5Nj...",
    "email": "you@example.com"
  }
}
}
}

```

### 3.3.5. Mirroring the OpenShift Container Platform image repository

Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

#### Prerequisites

- Your mirror host has access to the internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the [pull secret from the Red Hat OpenShift Cluster Manager](#) and modified it to include authentication to your mirror repository.
- If you use self-signed certificates, you have specified a Subject Alternative Name in the certificates.

#### Procedure

Complete the following steps on the mirror host:

1. Review the [OpenShift Container Platform downloads page](#) to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the [Repository Tags](#) page.
2. Set the required environment variables:
  - a. Export the release version:

```
$ OCP_RELEASE=<release_version>
```

For **<release\_version>**, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as **4.5.4**.

- b. Export the local registry name and host port:

```
$ LOCAL_REGISTRY='<local_registry_host_name>:<local_registry_host_port>'
```

For **<local\_registry\_host\_name>**, specify the registry domain name for your mirror repository, and for **<local\_registry\_host\_port>**, specify the port that it serves content on.

- c. Export the local repository name:

```
$ LOCAL_REPOSITORY='<local_repository_name>'
```

For **<local\_repository\_name>**, specify the name of the repository to create in your registry, such as **ocp4/openshift4**.

- d. Export the name of the repository to mirror:

```
$ PRODUCT_REPO='openshift-release-dev'
```

For a production release, you must specify **openshift-release-dev**.

- e. Export the path to your registry pull secret:

```
$ LOCAL_SECRET_JSON='<path_to_pull_secret>'
```

For **<path\_to\_pull\_secret>**, specify the absolute path to and file name of the pull secret for your mirror registry that you created.

- f. Export the release mirror:

```
$ RELEASE_NAME="ocp-release"
```

For a production release, you must specify **ocp-release**.

- g. Export the type of architecture for your server, such as **x86\_64**:

```
$ ARCHITECTURE=<server_architecture>
```

- h. Export the path to the directory to host the mirrored images:

```
$ REMOVABLE_MEDIA_PATH=<path> 1
```

- 1** Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the mirror registry:

- If your mirror host does not have internet access, take the following actions:
  - i. Connect the removable media to a system that is connected to the internet.
  - ii. Review the images and configuration manifests to mirror:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-
  image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE} --dry-run
```

- iii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.
- iv. Mirror the images to a directory on the removable media:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} --to-dir=${REMOVABLE_MEDIA_PATH}/mirror quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE}
```

- v. Take the media to the restricted network environment and upload the images to the local container registry.

```
$ oc image mirror -a ${LOCAL_SECRET_JSON} --from-dir=${REMOVABLE_MEDIA_PATH}/mirror "file://openshift/release:${OCP_RELEASE}" ${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} 1
```

- 1** For **REMOVABLE\_MEDIA\_PATH**, you must use the same path that you specified when you mirrored the images.

### IMPORTANT

Running **oc image mirror** might result in the following error: **error: unable to retrieve source image**. This error occurs when image indexes include references to images that no longer exist on the image registry. Image indexes might retain older references to allow users running those images an upgrade path to newer points on the upgrade graph. As a temporary workaround, you can use the **--skip-missing** option to bypass the error and continue downloading the image index. For more information, see [Service Mesh Operator mirroring failed](#).

- If the local container registry is connected to the mirror host, take the following actions:
  - i. Directly push the release images to the local registry by using following command:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE}
```

This command pulls the release information as a digest, and its output includes the **imageContentSources** data that you require when you install your cluster.

- ii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.

**NOTE**

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.

- To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:

- If your mirror host does not have internet access, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --icsp-file=<file> \ --
command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}"
```

- If the local container registry is connected to the mirror host, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
${ARCHITECTURE}"
```

**IMPORTANT**

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active internet connection.

- For clusters using installer-provisioned infrastructure, run the following command:

```
$ openshift-install
```

### 3.3.6. The Cluster Samples Operator in a disconnected environment

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

#### 3.3.6.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named **imagestreamtag-to-image** in the **openshift-cluster-samples-operator** namespace. The **imagestreamtag-to-image** config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is **<image\_stream\_name>\_<image\_stream\_tag\_name>**.

During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to **Removed**. If you choose to change it to **Managed**, it installs samples.

**NOTE**

The use of samples in a network-restricted or discontinued environment may require access to services external to your network. Some example services include: Github, Maven Central, npm, RubyGems, PyPi and others. There might be additional steps to take that allow the cluster samples operators's objects to reach the services they require.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to **Removed**, you can create your mirrored registry, or determine which existing mirrored registry you want to use.
- Mirror the samples you want to the mirrored registry using the new config map as your guide.
- Add any of the image streams you did not mirror to the **skippedImagestreams** list of the Cluster Samples Operator configuration object.
- Set **samplesRegistry** of the Cluster Samples Operator configuration object to the mirrored registry.
- Then set the Cluster Samples Operator to **Managed** to install the image streams you have mirrored.

### 3.3.7. Mirroring Operator catalogs for use with disconnected clusters

You can mirror the Operator contents of a Red Hat-provided catalog, or a custom catalog, into a container image registry using the **oc adm catalog mirror** command. The target registry must support [Docker v2-2](#). For a cluster on a restricted network, this registry can be one that the cluster has network access to, such as a mirror registry created during a restricted network cluster installation.

**IMPORTANT**

- The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.
- Running **oc adm catalog mirror** might result in the following error: **error: unable to retrieve source image**. This error occurs when image indexes include references to images that no longer exist on the image registry. Image indexes might retain older references to allow users running those images an upgrade path to newer points on the upgrade graph. As a temporary workaround, you can use the **--skip-missing** option to bypass the error and continue downloading the image index. For more information, see [Service Mesh Operator mirroring failed](#).

The **oc adm catalog mirror** command also automatically mirrors the index image that is specified during the mirroring process, whether it be a Red Hat-provided index image or your own custom-built index image, to the target registry. You can then use the mirrored index image to create a catalog source that allows Operator Lifecycle Manager (OLM) to load the mirrored catalog onto your OpenShift Container Platform cluster.

#### Additional resources

- [Using Operator Lifecycle Manager on restricted networks](#)

### 3.3.7.1. Prerequisites

Mirroring Operator catalogs for use with disconnected clusters has the following prerequisites:

- Workstation with unrestricted network access.
- **podman** version 1.9.3 or later.
- If you want to filter, or *prune*, the default catalog and selectively mirror only a subset of Operators, see the following sections:
  - [Installing the opm CLI](#)
  - [Filtering a SQLite-based index image](#)

- If you want to mirror a Red Hat–provided catalog, run the following command on your workstation with unrestricted network access to authenticate with **registry.redhat.io**:

```
$ podman login registry.redhat.io
```

- Access to a mirror registry that supports [Docker v2-2](#).
- On your mirror registry, decide which repository, or namespace, to use for storing mirrored Operator content. For example, you might create an **olm-mirror** repository.
- If your mirror registry does not have internet access, connect removable media to your workstation with unrestricted network access.
- If you are working with private registries, including **registry.redhat.io**, set the **REG\_CREDS** environment variable to the file path of your registry credentials for use in later steps. For example, for the **podman** CLI:

```
$ REG_CREDS=${XDG_RUNTIME_DIR}/containers/auth.json
```

### 3.3.7.2. Extracting and mirroring catalog contents

The **oc adm catalog mirror** command extracts the contents of an index image to generate the manifests required for mirroring. The default behavior of the command generates manifests, then automatically mirrors all of the image content from the index image, as well as the index image itself, to your mirror registry.

Alternatively, if your mirror registry is on a completely disconnected, or *airgapped*, host, you can first mirror the content to removable media, move the media to the disconnected environment, then mirror the content from the media to the registry.

#### 3.3.7.2.1. Mirroring catalog contents to registries on the same network

If your mirror registry is co-located on the same network as your workstation with unrestricted network access, take the following actions on your workstation.

#### Procedure

1. If your mirror registry requires authentication, run the following command to log in to the registry:

```
$ podman login <mirror_registry>
```

2. Run the following command to extract and mirror the content to the mirror registry:

```
$ oc adm catalog mirror \
  <index_image> \ 1
  <mirror_registry>:<port>[/<repository>] \ 2
  [-a ${REG_CREDS}] \ 3
  [--insecure] \ 4
  [--index-filter-by-os='<platform>/<arch>'] \ 5
  [--manifests-only] 6
```

- 1** Specify the index image for the catalog that you want to mirror. For example, this might be a pruned index image that you created previously, or one of the source index images for the default catalogs, such as **registry.redhat.io/redhat/redhat-operator-index:v4.10**.
- 2** Specify the fully qualified domain name (FQDN) for the target registry to mirror the Operator contents to. The mirror registry **<repository>** can be any existing repository, or namespace, on the registry, for example **olm-mirror** as outlined in the prerequisites. If there is an existing repository found during mirroring, the repository name is added to the resulting image name. If you do not want the image name to include the repository name, omit the **<repository>** value from this line, for example **<mirror\_registry>:<port>**.
- 3** Optional: If required, specify the location of your registry credentials file. **{REG\_CREDS}** is required for **registry.redhat.io**.
- 4** Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5** Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are passed as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, and **.\***
- 6** Optional: Generate only the manifests required for mirroring, and do not actually mirror the image content to a registry. This option can be useful for reviewing what will be mirrored, and it allows you to make any changes to the mapping list if you require only a subset of packages. You can then use the **mapping.txt** file with the **oc image mirror** command to mirror the modified list of images in a later step. This flag is intended for only advanced selective mirroring of content from the catalog; the **opm index prune** command, if you used it previously to prune the index image, is suitable for most catalog management use cases.

### Example output

```
src image has index label for database path: /database/index.db
using database path mapping: /database/index.db:/tmp/153048078
wrote database to /tmp/153048078 1
...
wrote mirroring manifests to manifests-redhat-operator-index-1614211642 2
```

- 1** Directory for the temporary **index.db** database generated by the command.

- 2 Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.

## NOTE

Red Hat Quay does not support nested repositories. As a result, running the **oc adm catalog mirror** command will fail with a **401** unauthorized error. As a workaround, you can use the **--max-components=2** option when running the **oc adm catalog mirror** command to disable the creation of nested repositories. For more information on this workaround, see the [Unauthorized error thrown while using catalog mirror command with Quay registry](#) Knowledgebase Solution.

## Additional resources

- [Architecture and operating system support for Operators](#)

### 3.3.7.2.2. Mirroring catalog contents to airgapped registries

If your mirror registry is on a completely disconnected, or airgapped, host, take the following actions.

#### Procedure

1. Run the following command on your workstation with unrestricted network access to mirror the content to local files:

```
$ oc adm catalog mirror \
  <index_image> \ 1
  file:///local/index \ 2
  -a ${REG_CREDS} \ 3
  --insecure \ 4
  --index-filter-by-os='<platform>/<arch>' 5
```

- 1 Specify the index image for the catalog that you want to mirror. For example, this might be a pruned index image that you created previously, or one of the source index images for the default catalogs, such as **registry.redhat.io/redhat/redhat-operator-index:v4.10**.
- 2 Specify the content to mirror to local files in your current directory.
- 3 Optional: If required, specify the location of your registry credentials file.
- 4 Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5 Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, and **.\***

#### Example output

```
...
info: Mirroring completed in 5.93s (5.915MB/s)
```

wrote mirroring manifests to manifests-my-index-1614985528 **1**

To upload local images to a registry, run:

```
oc adm catalog mirror file:///local/index/myrepo/my-index:v1 REGISTRY/REPOSITORY 2
```

- 1** Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.
- 2** Record the expanded **file://** path that is based on your provided index image. This path is referenced in a subsequent step.

This command creates a **v2/** directory in your current directory.

2. Copy the **v2/** directory to removable media.
3. Physically remove the media and attach it to a host in the disconnected environment that has access to the mirror registry.
4. If your mirror registry requires authentication, run the following command on your host in the disconnected environment to log in to the registry:

```
$ podman login <mirror_registry>
```

5. Run the following command from the parent directory containing the **v2/** directory to upload the images from local files to the mirror registry:

```
$ oc adm catalog mirror \
  file:///local/index/<repository>/<index_image>:<tag> \ 1
  <mirror_registry>:<port>[/<repository>] \ 2
  -a ${REG_CREDS} \ 3
  --insecure \ 4
  --index-filter-by-os='<platform>/<arch>' 5
```

- 1** Specify the **file://** path from the previous command output.
- 2** Specify the fully qualified domain name (FQDN) for the target registry to mirror the Operator contents to. The mirror registry **<repository>** can be any existing repository, or namespace, on the registry, for example **olm-mirror** as outlined in the prerequisites. If there is an existing repository found during mirroring, the repository name is added to the resulting image name. If you do not want the image name to include the repository name, omit the **<repository>** value from this line, for example **<mirror\_registry>:<port>**.
- 3** Optional: If required, specify the location of your registry credentials file.
- 4** Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5** Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, and **.\***

## NOTE

Red Hat Quay does not support nested repositories. As a result, running the **oc adm catalog mirror** command will fail with a **401** unauthorized error. As a workaround, you can use the **--max-components=2** option when running the **oc adm catalog mirror** command to disable the creation of nested repositories. For more information on this workaround, see the [Unauthorized error thrown while using catalog mirror command with Quay registry](#) Knowledgebase Solution.

- Run the **oc adm catalog mirror** command again. Use the newly mirrored index image as the source and the same mirror registry target used in the previous step:

```
$ oc adm catalog mirror \
  <mirror_registry>:<port>/<index_image> \
  <mirror_registry>:<port>/[<repository>] \
  --manifests-only 1 \
  [-a ${REG_CREDS}] \
  [--insecure]
```

- The **--manifests-only** flag is required for this step so that the command does not copy all of the mirrored content again.

## IMPORTANT

This step is required because the image mappings in the **imageContentSourcePolicy.yaml** file generated during the previous step must be updated from local paths to valid mirror locations. Failure to do so will cause errors when you create the **ImageContentSourcePolicy** object in a later step.

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the **ImageContentSourcePolicy** and **CatalogSource** objects. These objects are required to enable installation of Operators from OperatorHub.

### Additional resources

- [Architecture and operating system support for Operators](#)

### 3.3.7.3. Generated manifests

After mirroring Operator catalog content to your mirror registry, a manifests directory is generated in your current directory.

If you mirrored content to a registry on the same network, the directory name takes the following pattern:

```
manifests-<index_image_name>-<random_number>
```

If you mirrored content to a registry on a disconnected host in the previous section, the directory name takes the following pattern:

```
manifests-index/<repository>/<index_image_name>-<random_number>
```

**NOTE**

The manifests directory name is referenced in subsequent procedures.

The manifests directory contains the following files, some of which might require further modification:

- The **catalogSource.yaml** file is a basic definition for a **CatalogSource** object that is pre-populated with your index image tag and other relevant metadata. This file can be used as is or modified to add the catalog source to your cluster.

**IMPORTANT**

If you mirrored the content to local files, you must modify your **catalogSource.yaml** file to remove any backslash (/) characters from the **metadata.name** field. Otherwise, when you attempt to create the object, it fails with an "invalid resource name" error.

- The **imageContentSourcePolicy.yaml** file defines an **ImageContentSourcePolicy** object that can configure nodes to translate between the image references stored in Operator manifests and the mirrored registry.

**NOTE**

If your cluster uses an **ImageContentSourcePolicy** object to configure repository mirroring, you can use only global pull secrets for mirrored registries. You cannot add a pull secret to a project.

- The **mapping.txt** file contains all of the source images and where to map them in the target registry. This file is compatible with the **oc image mirror** command and can be used to further customize the mirroring configuration.

**IMPORTANT**

If you used the **--manifests-only** flag during the mirroring process and want to further trim the subset of packages to mirror, see the steps in the [Mirroring a package manifest format catalog image](#) procedure of the OpenShift Container Platform 4.7 documentation about modifying your **mapping.txt** file and using the file with the **oc image mirror** command.

#### 3.3.7.4. Post-installation requirements

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the **ImageContentSourcePolicy** and **CatalogSource** objects. These objects are required to populate and enable installation of Operators from OperatorHub.

#### Additional resources

- [Populating OperatorHub from mirrored Operator catalogs](#)

#### 3.3.8. Next steps

- Install a cluster on infrastructure that you provision in your restricted network, such as on [VMware vSphere](#), [bare metal](#), or [Amazon Web Services](#).

### 3.3.9. Additional resources

- See [Gathering data about specific features](#) for more information about using must-gather.

## 3.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUGIN

You can ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

You can use the oc-mirror OpenShift CLI (**oc**) plugin to mirror images to a mirror registry in your fully or partially disconnected environments.

### IMPORTANT

Mirroring images for disconnected environments using the oc-mirror plugin is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

The following steps outline the high-level workflow on how to use the oc-mirror plugin to mirror images to a mirror registry:

1. Create an image set configuration file.
2. Mirror the image set to the mirror registry.
3. Configure your cluster to use the resources generated by the oc-mirror plugin.
4. Repeat these steps to update your mirror registry as necessary.

### 3.4.1. About the oc-mirror plugin

You can use the oc-mirror OpenShift CLI (**oc**) plugin to mirror all required OpenShift Container Platform content and other images to your mirror registry by using a single tool. It provides the following features:

- Provides a centralized method to mirror OpenShift Container Platform releases, Operators, helm charts, and other images.
- Maintains update paths for OpenShift Container Platform and Operators.
- Uses a declarative image set configuration file to include only the OpenShift Container Platform releases, Operators, and images that your cluster needs.

- Performs incremental mirroring, which reduces the size of future image sets.

When using the `oc-mirror` plugin, you specify which content to mirror in an image set configuration file. In this YAML file, you can fine-tune the configuration to only include the OpenShift Container Platform releases and Operators that your cluster needs. This reduces the amount of data that you need to download and transfer. The `oc-mirror` plugin can also mirror arbitrary helm charts and additional container images to assist users in seamlessly synchronizing their workloads onto mirror registries.

The first time you run the `oc-mirror` plugin, it populates your mirror registry with the required content to perform your disconnected cluster installation. In order for your disconnected cluster to continue receiving updates, you must keep your mirror registry updated. To update your mirror registry, you run the `oc-mirror` plugin using the same configuration as the first time you ran it. The `oc-mirror` plugin references the metadata from the storage backend and only downloads what has been released since the last time you ran the tool. This provides update paths for OpenShift Container Platform and Operators and performs dependency resolution as required.

### IMPORTANT

When using the `oc-mirror` CLI plugin to populate a mirror registry, any further updates to the mirror registry must be made using the `oc-mirror` tool.

## 3.4.2. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry that supports [Docker v2-2](#), such as Red Hat Quay. If you do not have access to a large-scale container registry, you can use the *mirror registry for Red Hat OpenShift*, which is a small-scale container registry included with OpenShift Container Platform subscriptions.

Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

### IMPORTANT

The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the *mirror registry for Red Hat OpenShift*, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the `crictl images` command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

**NOTE**

Red Hat does not test third party registries with OpenShift Container Platform.

**Additional resources**

- For information about viewing the CRI-O logs to view the image source, see [Viewing the image pull source](#).

**3.4.3. Prerequisites**

- You must have a container image registry that supports [Docker v2-2](#) in the location that will host the OpenShift Container Platform cluster, such as Red Hat Quay.

**NOTE**

If you use Red Hat Quay, you must use version 3.6 or later with the `oc-mirror` plugin. If you have an entitlement to Red Hat Quay, see the documentation on [deploying Red Hat Quay for proof-of-concept purposes](#) or [by using the Quay Operator](#). If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat Support.

If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a [mirror registry for Red Hat OpenShift](#). The *mirror registry for Red Hat OpenShift* is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

**3.4.4. Preparing your mirror hosts**

Before you can use the `oc-mirror` plugin to mirror images, you must install the plugin and create a container image registry credentials file to allow the mirroring from Red Hat to your mirror.

**3.4.4.1. Installing the `oc-mirror` OpenShift CLI plugin**

To use the `oc-mirror` OpenShift CLI plugin to mirror registry images, you must install the plugin. If you are mirroring image sets in a fully disconnected environment, ensure that you install the `oc-mirror` plugin on the host with internet access and the host in the disconnected environment with access to the mirror registry.

**Prerequisites**

- You have installed the OpenShift CLI (**oc**).

**Procedure**

1. Download the `oc-mirror` CLI plugin.
  - a. Navigate to the [Downloads](#) page of the [OpenShift Cluster Manager](#).
  - b. Under the **OpenShift disconnected installation tools** section, click **Download** for **OpenShift Client (oc) mirror plugin** and save the file.
2. Extract the archive:

```
$ tar xvzf oc-mirror.tar.gz
```

3. If necessary, update the plugin file to be executable:

```
$ chmod +x oc-mirror
```

**NOTE**

Do not rename the **oc-mirror** file.

4. Install the oc-mirror CLI plugin by placing the file in your **PATH**, for example, **/usr/local/bin**:

```
$ sudo mv oc-mirror /usr/local/bin/.
```

**Verification**

- Run **oc mirror help** to verify that the plugin was successfully installed:

```
$ oc mirror help
```

**Additional resources**

- [Installing and using CLI plugins](#)

**3.4.4.2. Configuring credentials that allow images to be mirrored**

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

**WARNING**

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

**WARNING**

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

**Prerequisites**

- You configured a mirror registry to use in your disconnected environment.

- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

## Procedure

Complete the following steps on the installation host:

1. Download your **registry.redhat.io** pull secret from the [Red Hat OpenShift Cluster Manager](#) .
2. Make a copy of your pull secret in JSON format:

```
$ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json> 1
```

- 1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

3. Save the file either as `~/.docker/config.json` or `$XDG_RUNTIME_DIR/containers/auth.json`. The contents of the file resemble the following example:

```
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

4. Generate the base64-encoded user name and password or token for your mirror registry:

```
$ echo -n '<user_name>:<password>' | base64 -w0 1
BGVtbYk3ZHAtdXs=
```

- 1 For `<user_name>` and `<password>`, specify the user name and password that you configured for your registry.

5. Edit the JSON file and add a section that describes your registry to it:

```
"auths": {
```

```
"<mirror_registry>": { 1
  "auth": "<credentials>", 2
  "email": "you@example.com"
}
},
```

- 1 For **<mirror\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:8443**
- 2 For **<credentials>**, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{
  "auths": {
    "registry.example.com": {
      "auth": "BGVtbYk3ZHAqXs=",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

### 3.4.5. Creating the image set configuration

Before you can use the `oc-mirror` plugin to mirror image sets, you must create an image set configuration file. This image set configuration file defines which OpenShift Container Platform releases, Operators, and other images to mirror, along with other configuration settings for the `oc-mirror` plugin.

You must specify a storage backend in the image set configuration file. This storage backend can be a local directory or a registry that supports [Docker v2-2](#). The `oc-mirror` plugin stores metadata in this storage backend during image set creation.

## IMPORTANT

Do not delete or modify the metadata that is generated by the `oc-mirror` plugin. You must use the same storage backend every time you run the `oc-mirror` plugin for the same mirror registry.

### Procedure

1. Create an **ImageSetConfiguration** resource that specifies the necessary configuration details:

#### Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1alpha1
kind: ImageSetConfiguration
archiveSize: 4 1
mirror:
  ocp:
    channels:
      - name: stable-4.9 2
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.9 3
storageConfig: 4
registry:
  imageURL: example.com/example/oc-mirror 5
```

- 1** The maximum size, in GiB, of each file within the image set.
- 2** The channel to retrieve the OpenShift Container Platform images from.
- 3** The Operator catalog to retrieve the OpenShift Container Platform images from.
- 4** The back-end location to save the image set metadata to. This location can be a registry or local directory. It is required to specify **storageConfig** values.
- 5** The registry URL for the storage backend.

This example pulls images from the **stable-4.9** channel for the **registry.redhat.io/redhat/redhat-operator-index:v4.9** operator catalog and saves the image set metadata to the **example.com/example/oc-mirror** registry.

2. Save the file as **imageset-config.yaml**. This file is required by the **oc mirror** command when mirroring content.

### Additional resources

- [Image set configuration parameters](#)
- [Image set configuration examples](#)

### 3.4.6. Mirroring an image set to a mirror registry

You can use the `oc-mirror` CLI plugin to mirror images to a mirror registry in a [partially disconnected environment](#) or in a [fully disconnected environment](#).

These procedures assume that you already have your mirror registry set up.

### 3.4.6.1. Mirroring an image set in a partially disconnected environment

In a partially disconnected environment, you can mirror an image set directly to the target mirror registry.

#### 3.4.6.1.1. Mirroring from mirror to mirror

You can use the `oc-mirror` plugin to mirror an image set directly to a target mirror registry that is accessible during image set creation.

#### IMPORTANT

Depending on the configuration specified in the image set configuration file, using `oc-mirror` to mirror images might download several hundreds of gigabytes of data to disk before mirroring to the destination mirror registry.

The initial image set download when you populate the mirror registry is often the largest. Because you only download the images that changed since the last time you ran the command, when you run the `oc-mirror` plugin again, the generated image set is often smaller.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a Docker v2 registry. The `oc-mirror` plugin stores metadata in this storage backend during image set creation.

#### IMPORTANT

Do not delete or modify the metadata that is generated by the `oc-mirror` plugin. You must use the same storage backend every time you run the `oc-mirror` plugin for the same mirror registry.

#### Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (**oc**).
- You have installed the **oc-mirror** CLI plugin.
- You have created the image set configuration file.

#### Procedure

- Run the **oc mirror** command to mirror the images from the specified image set configuration to a specified registry:

```
$ oc mirror --config=./imageset-config.yaml \ 1
docker://registry.example:5000 2
```

- 1 Pass in the image set configuration file that was created. This procedure assumes that it is named **imageset-config.yaml**.

- 2

Specify the registry to mirror the image set file to. The registry must start with **docker://**. If you specify a top-level namespace for the mirror registry, you must also use this same

### Verification

1. Navigate into the **oc-mirror-workspace/** directory that was generated.
2. Navigate into the results directory, for example, **results-1639608409/**.
3. Verify that YAML files are present for the **ImageContentSourcePolicy** and **CatalogSource** resources.

### Next steps

- Configure your cluster to use the resources generated by oc-mirror.

### 3.4.6.2. Mirroring an image set in a fully disconnected environment

To mirror an image set in a fully disconnected environment, you must first [mirror the image set to disk](#), then [mirror the image set file on disk to a mirror](#).

#### 3.4.6.2.1. Mirroring from mirror to disk

You can use the oc-mirror plugin to generate an image set and save the contents to disk. The generated image set can then be transferred to the disconnected environment and mirrored to the target registry.

#### IMPORTANT

Depending on the configuration specified in the image set configuration file, using oc-mirror to mirror images might download several hundreds of gigabytes of data to disk.

The initial image set download when you populate the mirror registry is often the largest. Because you only download the images that changed since the last time you ran the command, when you run the oc-mirror plugin again, the generated image set is often smaller.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a docker v2 registry. The oc-mirror plugin stores metadata in this storage backend during image set creation.

#### IMPORTANT

Do not delete or modify the metadata that is generated by the oc-mirror plugin. You must use the same storage backend every time you run the oc-mirror plugin for the same mirror registry.

### Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (**oc**).

- You have installed the **oc-mirror** CLI plugin.
- You have created the image set configuration file.

### Procedure

- Run the **oc mirror** command to mirror the images from the specified image set configuration to disk:

```
$ oc mirror --config=./imageset-config.yaml \ 1  
file://<path_to_output_directory> 2
```

- 1 Pass in the image set configuration file that was created. This procedure assumes that it is named **imageset-config.yaml**.
- 2 Specify the target directory where you want to output the image set file. The target directory path must start with **file://**.

### Verification

1. Navigate to your output directory:

```
$ cd <path_to_output_directory>
```

2. Verify that an image set **.tar** file was created:

```
$ ls
```

#### Example output

```
mirror_seq1_000000.tar
```

### Next steps

- Transfer the image set **.tar** file to the disconnected environment.

#### 3.4.6.2.2. Mirroring from disk to mirror

You can use the **oc-mirror** plugin to mirror the contents of a generated image set to the target mirror registry.

### Prerequisites

- You have installed the OpenShift CLI (**oc**) in the disconnected environment.
- You have installed the **oc-mirror** CLI plugin in the disconnected environment.
- You have generated the image set file by using the **oc mirror** command.
- You have transferred the image set file to the disconnected environment.

### Procedure

- Run the **oc mirror** command to process the image set file on disk and mirror the contents to a target mirror registry:

```
$ oc mirror --from=./mirror_seq1_000000.tar \ 1
docker://registry.example:5000 2
```

- 1 Pass in the image set .tar file to mirror, named **mirror\_seq1\_000000.tar** in this example. If an **archiveSize** value was specified in the image set configuration file, the image set might be broken up into multiple .tar files. In this situation, you can pass in a directory that contains the image set .tar files.
- 2 Specify the registry to mirror the image set file to. The registry must start with **docker://**. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

This command updates the mirror registry with the image set and generates the **ImageContentSourcePolicy** and **CatalogSource** resources.

### Verification

1. Navigate into the **oc-mirror-workspace/** directory that was generated.
2. Navigate into the results directory, for example, **results-1639608409/**.
3. Verify that YAML files are present for the **ImageContentSourcePolicy** and **CatalogSource** resources.

### Next steps

- Configure your cluster to use the resources generated by oc-mirror.

### 3.4.7. Configuring your cluster to use the resources generated by oc-mirror

After you have mirrored your image set to the mirror registry, you must apply the generated **ImageContentSourcePolicy**, **CatalogSource**, and release image signature resources into the cluster.

The **ImageContentSourcePolicy** resource associates the mirror registry with the source registry and redirects image pull requests from the online registries to the mirror registry. The **CatalogSource** resource is used by Operator Lifecycle Manager (OLM) to retrieve information about the available Operators in the mirror registry. The release image signatures are used to verify the mirrored release images.

### Prerequisites

- You have mirrored the image set to the registry mirror in the disconnected environment.
- You have access to the cluster as a user with the **cluster-admin** role.

### Procedure

1. Log in to the OpenShift CLI as a user with the **cluster-admin** role.
2. Apply the YAML files from the results directory to the cluster by running the following command:

```
$ oc apply -f ./oc-mirror-workspace/results-1639608409/
```

3. Apply the release image signatures to the cluster by running the following command:

```
$ oc apply -f ./oc-mirror-workspace/results-1639608409/release-signatures/
```

## Verification

1. Verify that the **ImageContentSourcePolicy** resources were successfully installed by running the following command:

```
$ oc get imagecontentsourcepolicy --all-namespaces
```

2. Verify that the **CatalogSource** resources were successfully installed by running the following command:

```
$ oc get catalogsource --all-namespaces
```

### 3.4.8. Updating your mirror registry

After you publish a full image set to the mirror registry, you can use the oc-mirror plugin to update the mirror registry with updated images.

When you run the oc-mirror plugin again, it generates an image set that only contains new and updated images since the previous execution.

#### NOTE

You must use the same storage backend as the initial execution of oc-mirror for the same mirror registry. Do not delete or modify the metadata that is generated by the oc-mirror plugin.

Because it only pulls in the differences since the previous image set was created, the generated image set is often smaller and faster to process than the initial image set.

#### IMPORTANT

Generated image sets are sequential and must be synchronized to the target mirror registry in order.

## Prerequisites

- You have used the oc-mirror plugin to mirror the initial image set to your mirror registry.
- You have access to the storage backend that was used for the initial execution of the oc-mirror plugin.

## Procedure

1. Follow the same steps that you used to create the initial image set and mirror it to the mirror registry. For instructions, see *Mirroring an image set in a partially disconnected environment* or *Mirroring an image set in a fully disconnected environment*.

## IMPORTANT

- You must provide the same storage backend so that only a differential image set is created and mirrored.
- If you specified a top-level namespace for the mirror registry during the initial image set creation, then you must use this same namespace every time you run the oc-mirror plugin for the same mirror registry.

2. Configure your cluster to use the resources generated by oc-mirror.

### Additional resources

- [Mirroring an image set in a partially disconnected environment](#)
- [Mirroring an image set in a fully disconnected environment](#)
- [Configuring your cluster to use the resources generated by oc-mirror](#)

### 3.4.9. Image set configuration parameters

The oc-mirror plugin requires an image set configuration file that defines what images to mirror. The following table lists the available parameters for the **ImageSetConfiguration** resource.

Table 3.1. ImageSetConfiguration parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>ImageSetConfiguration</b> content.	String. For example: <b>mirror.openshift.io/v1alpha1</b> .
<b>archiveSize</b>	The maximum size, in GiB, of each archive file within the image set.	Integer. For example: <b>4</b>
<b>mirror</b>	The configuration of the image set.	Object
<b>mirror.additionalImages</b>	The additional images configuration of the image set.	Array of objects. For example: <pre> additionalImages:   - name:     registry.redhat.io/ubi8/ubi:latest </pre>
<b>mirror.additionalImages.name</b>	The tag of the image to mirror.	String. For example: <b>registry.redhat.io/ubi8/ubi:latest</b>

Parameter	Description	Values
<b>mirror.helm</b>	The helm configuration of the image set. Note that the oc-mirror plugin supports only helm charts that do not require user input when rendered.	Object
<b>mirror.helm.local</b>	The local helm charts to mirror.	Array of objects. For example: <pre>local:   - name:     podinfo     path:       /test/podinfo-       5.0.0.tar.gz</pre>
<b>mirror.helm.local.name</b>	The name of the local helm chart to mirror.	String. For example: <b>podinfo</b> .
<b>mirror.helm.local.path</b>	The path of the local helm chart to mirror.	String. For example: <b>/test/podinfo-5.0.0.tar.gz</b> .
<b>mirror.helm.repos</b>	The remote helm repositories to mirror from.	Array of objects. For example: <pre>repos:   - name:     podinfo     url:       https://example.github.io/podinfo     charts:       - name:         podinfo         version:           5.0.0</pre>
<b>mirror.helm.repos.name</b>	The name of the helm repository to mirror from.	String. For example: <b>podinfo</b> .
<b>mirror.helm.repos.url</b>	The URL of the helm repository to mirror from.	String. For example: <b>https://example.github.io/podinfo</b> .

Parameter	Description	Values
<b>mirror.helm.repos.charts</b>	The remote helm charts to mirror.	Array of objects.
<b>mirror.helm.repos.charts.name</b>	The name of the helm chart to mirror.	String. For example: <b>podinfo</b> .
<b>mirror.helm.repos.charts.version</b>	The version of the named helm chart to mirror.	String. For example: <b>5.0.0</b> .
<b>mirror.ocp</b>	The platform configuration of the image set.	Object
<b>mirror.ocp.channels</b>	The platform channel configuration of the image set.	Array of objects. For example: <pre> channels:   - name:     stable-4.7   - name:     stable-4.6 versions:   - '4.6.36'</pre>
<b>mirror.ocp.channels.name</b>	The name of the release channel.	String. For example: <b>stable-4.9</b> or <b>okd</b> .
<b>mirror.ocp.channels.versions</b>	The list of release versions within the named channel.	String. For example: <b>4.9.6</b> .
<b>mirror.operators</b>	The Operators configuration of the image set.	Array of objects. For example: <pre> operators:   - catalog:     registry.redhat.io/redhat/redhat-operator-index:v4.9     headsOnly:       false     packages:       - name:         elasticsearch-operator  startingVersion: '2.4.0'</pre>

Parameter	Description	Values
<b>mirror.operators.catalog</b>	The Operator catalog to include in the image set.	String. For example: <b>registry.redhat.io/redhat/redhat-operator-index:v4.9.</b>
<b>mirror.operators.headsOnly</b>	Toggles between downloading channel HEADs and full channels. Cannot be used in conjunction with <b>mirror.operators.packages.</b>	Boolean
<b>mirror.operators.packages</b>	The Operator packages configuration.	Array of objects. For example: <pre> operators:   - catalog:       registry.redhat.io/redhat/redhat-operator-index:v4.8       headsOnly:         false       packages:         - name:             elasticsearch-operator  startingVersion: '5.2.3-31' </pre>
<b>mirror.operators.packages.name</b>	The Operator package name to include in the image set	String. For example: <b>elasticsearch-operator.</b>
<b>mirror.operators.packages.startingVersion</b>	The starting version of the Operator package to mirror. All versions of the Operator are mirrored between the value of <b>startingVersion</b> and the HEAD version of each channel that contains the referenced version.	String. For example: <b>5.2.3-31.</b>
<b>mirror.operators.packages.channels</b>	The Operator package channel configuration.	Object
<b>mirror.operators.packages.channels.name</b>	The Operator channel name, unique within a package, to include in the image set.	String. For example: <b>fast</b> or <b>stable-v4.9.</b>

Parameter	Description	Values
<b>mirror.operators.packages.channels.startingVersion</b>	The starting version of the Operator channel to mirror. All versions of the Operator are mirrored between the value of <b>startingVersion</b> and the HEAD version of the specified channel.	String. For example: <b>5.2.3-31</b>
<b>storageConfig</b>	The back-end configuration of the image set.	Object
<b>storageConfig.local</b>	The local back-end configuration of the image set.	Object
<b>storageConfig.local.path</b>	The path of the directory to contain the image set metadata.	String. For example: <b>./path/to/dir/</b> .
<b>storageConfig.registry</b>	The registry back-end configuration of the image set.	Object
<b>storageConfig.registry.imageURL</b>	The back-end registry URI. Can optionally include a namespace reference in the URI.	String. For example: <b>quay.io/myuser/imageset:metadata</b> .
<b>storageConfig.registry.skipTLS</b>	Optionally skip TLS verification of the referenced back-end registry.	Boolean. The default value is <b>false</b> .

### 3.4.10. Image set configuration examples

The following **ImageSetConfiguration** file examples show the configuration for various mirroring use cases.

#### Use case: Including arbitrary images and helm charts

The following **ImageSetConfiguration** file uses a registry storage backend and includes helm charts and an additional Red Hat Universal Base Image (UBI).

#### Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1alpha1
kind: ImageSetConfiguration
archiveSize: 4
storageConfig:
  registry:
    imageURL: example.com/example/oc-mirror
    skipTLS: false
mirror:
  ocp:
    channels:
```

```

- name: stable-4.10
operators:
- catalog: registry.redhat.io/redhat/redhat-operator-index:v4.10
helm:
repos:
- name: redhat-helm-charts
url: https://raw.githubusercontent.com/redhat-developer/redhat-helm-charts/master
charts:
- name: ibm-mongodb-enterprise-helm
version: 0.2.0
additionalImages:
- name: registry.redhat.io/ubi8/ubi:latest

```

### Use case: Including specific Operator versions

The following **ImageSetConfiguration** file uses a local storage backend and includes only the Red Hat Advanced Cluster Security for Kubernetes Operator, versions starting at 3.67.0 and later.

### Example ImageSetConfiguration file

```

apiVersion: mirror.openshift.io/v1alpha1
kind: ImageSetConfiguration
storageConfig:
local:
path: /home/user/metadata
mirror:
operators:
- catalog: registry.redhat.io/redhat/redhat-operator-index:v4.10
headsOnly: false
packages:
- name: rhacs-operator
channels:
- name: latest
startingVersion: 3.67.0

```

### 3.4.11. Command reference for oc-mirror

The following tables describe the **oc mirror** subcommands and flags:

Table 3.2. oc mirror subcommands

Subcommand	Description
<b>completion</b>	Generate the autocompletion script for the specified shell.
<b>describe</b>	Output the contents of an image set.
<b>help</b>	Show help about any subcommand.
<b>list</b>	List available platform and Operator content and their version.
<b>version</b>	Output the oc-mirror version.

Table 3.3. oc mirror flags

Flag	Description
<b>-c, --config &lt;string&gt;</b>	Specify the path to an image set configuration file.
<b>--continue-on-error</b>	If any non image-pull related error occurs, continue and attempt to mirror as much as possible.
<b>--dest-skip-tls</b>	Disable TLS validation for the target registry.
<b>--dest-use-http</b>	Use plain HTTP for the target registry.
<b>--dry-run</b>	Print actions without mirroring images.
<b>--from &lt;string&gt;</b>	Specify the path to an image set archive that was generated by an execution of oc-mirror to load into a target registry.
<b>-h, --help</b>	Show the help.
<b>--log-level &lt;string&gt;</b>	Specify the number for the log level verbosity. Valid values are <b>0 - 9</b> . The default is <b>0</b> .
<b>--manifests-only</b>	Generate manifests for <b>ImageContentSourcePolicy</b> objects to configure a cluster to use the mirror registry, but do not actually mirror any images. To use this flag, you must pass in an image set archive with the <b>--from</b> flag.
<b>--skip-cleanup</b>	Skip removal of artifact directories.
<b>--skip-image-pin</b>	Do not replace image tags with digest pins in Operator catalogs.
<b>--skip-missing</b>	If an image is not found, skip it instead of reporting an error and aborting execution. Does not apply to custom images explicitly specified in the image set configuration.
<b>--skip-verification</b>	Skip digest verification.
<b>--source-skip-tls</b>	Disable TLS validation for the source registry.
<b>--source-use-http</b>	Use plain HTTP for the source registry.

## CHAPTER 4. INSTALLING ON ALIBABA

### 4.1. PREPARING TO INSTALL ON ALIBABA CLOUD

#### IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

#### 4.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 4.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud

Before installing OpenShift Container Platform on Alibaba Cloud, you must configure and register your domain, create a Resource Access Management (RAM) user for the installation, and review the supported Alibaba Cloud data center regions and zones for the installation.

#### 4.1.3. Registering and Configuring Alibaba Cloud Domain

To install OpenShift Container Platform, the Alibaba Cloud account you use must have a dedicated public hosted zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Alibaba Cloud or another source.

#### NOTE

If you purchase a new domain through Alibaba Cloud, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through Alibaba Cloud, see [Alibaba Cloud domains](#).

2. If you are using an existing domain and registrar, migrate its DNS to Alibaba Cloud. See [Domain name transfer](#) in the Alibaba Cloud documentation.
3. Configure DNS for your domain. This includes:
  - [Registering a generic domain name](#).

- [Completing real-name verification for your domain name](#) .
  - [Applying for an Internet Content Provider \(ICP\) filing](#) .
  - [Enabling domain name resolution](#).  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you are using a subdomain, follow the procedures of your company to add its delegation records to the parent domain.

#### 4.1.4. Supported Alibaba regions

You can deploy an OpenShift Container Platform cluster to the regions listed in the [Alibaba Regions and zones documentation](#).

#### 4.1.5. Next steps

- [Create the required Alibaba Cloud resources](#) .

## 4.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES

Before you install OpenShift Container Platform, you must use the Alibaba Cloud console to create a Resource Access Management (RAM) user that has sufficient permissions to install OpenShift Container Platform into your Alibaba Cloud. This user must also have permissions to create new RAM users. You can also configure and use the **ccocli** tool to create new credentials for the OpenShift Container Platform components with the permissions that they require.

### IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#) .

### 4.2.1. Creating the required RAM user

You must have a Alibaba Cloud Resource Access Management (RAM) user for the installation that has sufficient privileges. You can use the Alibaba Cloud Resource Access Management console to create a new user or modify an existing user. Later, you create credentials in OpenShift Container Platform based on this user's permissions.

When you configure the RAM user, be sure to consider the following requirements:

- The user must have an Alibaba Cloud AccessKey ID and AccessKey secret pair.
  - For a new user, you can select **Open API Access** for the Access Mode when creating the user. This mode generates the required AccessKey pair.

- For an existing user, you can add an AccessKey pair or you can [obtain the AccessKey pair](#) for that user.

#### NOTE

When created, the AccessKey secret is displayed only once. You must immediately save the AccessKey pair because the AccessKey pair is required for API calls.

- Add the AccessKey ID and secret to the `~/.alibabacloud/credentials` file on your local computer. Alibaba Cloud automatically creates this file when you log in to the console. The Cloud Credential Operator (CCO) utility, `ccoutil`, uses these credentials when processing **Credential Request** objects.

For example:

```
[default]                # Default client
type = access_key        # Certification type: access_key
access_key_id = LTAI5t8cefXKmt    # Key 1
access_key_secret = wYx56mszAN4Uunfh    # Secret
```

- 1 Add your AccessKeyID and AccessKeySecret here.

- The RAM user must have the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the OpenShift Container Platform cluster. This policy grants permissions to manage all Alibaba Cloud resources. When you attach the **AdministratorAccess** policy to a RAM user, you grant that user full access to all Alibaba Cloud services and resources. If you do not want to create a user with full access, create a custom policy with the following actions that you can add to your RAM user for installation. These actions are sufficient to install OpenShift Container Platform.

#### TIP

You can copy and paste the following JSON code into the Alibaba Cloud console to create a custom policy. For information on creating custom policies, see [Create a custom policy](#) in the Alibaba Cloud documentation.

#### Example 4.1. Example custom policy JSON file

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "tag:ListTagResources",
        "tag:UntagResources"
      ],
      "Resource": "*",
      "Effect": "Allow"
    },

}

```

For more information about creating a RAM user and granting permissions, see [Create a RAM user](#) and [Grant permissions to a RAM user](#) in the Alibaba Cloud documentation.

#### 4.2.2. Configuring the Cloud Credential Operator utility

To assign RAM users and policies that provide long-lived RAM AccessKeys (AKs) for each in-cluster component, extract and prepare the Cloud Credential Operator (CCO) utility (**ccoctl**) binary.

#### NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

#### Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).

#### Procedure

1. Obtain the OpenShift Container Platform release image:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Get the CCO container image from the OpenShift Container Platform release image:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE)
```

#### NOTE

Ensure that the architecture of the **\$RELEASE\_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable:

```
$ chmod 775 ccoctl
```

## Verification

- To verify that **ccoctl** is ready to use, display the help file:

```
$ ccoctl --help
```

### Output of **ccoctl --help**

OpenShift credentials provisioning tool

Usage:

```
ccoctl [command]
```

Available Commands:

alibabacloud Manage credentials objects for alibaba cloud

aws Manage credentials objects for AWS cloud

gcp Manage credentials objects for Google cloud

help Help about any command

ibmcloud Manage credentials objects for IBM Cloud

Flags:

```
-h, --help help for ccoctl
```

Use "ccoctl [command] --help" for more information about a command.

## Additional resources

- [Preparing to update a cluster with manually maintained credentials](#)

### 4.2.3. Next steps

- Install a cluster on Alibaba Cloud infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:
  - [Installing a cluster quickly on Alibaba Cloud](#) You can install a cluster quickly by using the default configuration options.
  - [Installing a customized cluster on Alibaba Cloud](#) The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).

## 4.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD

In OpenShift Container Platform version 4.10, you can install a cluster on Alibaba Cloud that uses the default configuration options.

## IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

### 4.3.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- You have [created the required Alibaba Cloud resources](#).
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

### 4.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.3.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**4.3.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.

2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

#### 4.3.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

##### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

##### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **alibabacloud** as the platform to target.
  - iii. Select the region to deploy the cluster to.
  - iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
  - v. Provide a descriptive name for your cluster.
  - vi. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**:

**Example install-config.yaml configuration file with credentialsMode set to Manual**

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** Add this line to set the **credentialsMode** to **Manual**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 4.3.6. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

#### Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the directory in which the installation program creates files.

### 4.3.7. Creating credentials for OpenShift Container Platform components with the `ccoctl` tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

#### NOTE

By default, `ccoctl` creates objects in the directory in which the commands are run. To create the objects in a different directory, use the `--output-dir` flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

#### Prerequisites

You must have:

- Extracted and prepared the `ccoctl` binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (`access_key_id`) and AccessKeySecret (`access_key_secret`) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.

#### Procedure

1. Set the `$RELEASE_IMAGE` variable by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Extract the list of `CredentialsRequest` objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --credentials-requests \
  --cloud=alibabacloud \
```

```
--to=<path_to_directory_with_list_of_credentials_requests>/credrequests \ 1
$RELEASE_IMAGE
```

- 1** **credrequests** is the directory where the list of **CredentialsRequest** objects is stored. This command creates the directory if it does not exist.

#### NOTE

This command can take a few moments to run.

3. If your cluster uses cluster capabilities to disable one or more optional components, delete the **CredentialsRequest** custom resources for any disabled components.

### Example credrequests directory contents for OpenShift Container Platform 4.12 on Alibaba Cloud

```
0000_30_machine-api-operator_00_credentials-request.yaml 1
0000_50_cluster-image-registry-operator_01-registry-credentials-request-alibaba.yaml 2
0000_50_cluster-ingress-operator_00-ingress-credentials-request.yaml 3
0000_50_cluster-storage-operator_03_credentials_request_alibaba.yaml 4
```

- 1** The Machine API Operator CR is required.
- 2** The Image Registry Operator CR is required.
- 3** The Ingress Operator CR is required.
- 4** The Storage Operator CR is an optional component and might be disabled in your cluster.

4. Use the **ccoctl** tool to process all **CredentialsRequest** objects in the **credrequests** directory:
  - a. Run the following command to use the tool:

```
$ ccoctl alibabacloud create-ram-users \
--name <name> \
--region=<alibaba_region> \
--credentials-requests-dir=
<path_to_directory_with_list_of_credentials_requests>/credrequests \
--output-dir=<path_to_ccoctl_output_dir>
```

where:

- **<name>** is the name used to tag any cloud resources that are created for tracking.
- **<alibaba\_region>** is the Alibaba Cloud region in which cloud resources will be created.
- **<path\_to\_directory\_with\_list\_of\_credentials\_requests>/credrequests** is the directory containing the files for the component **CredentialsRequest** objects.
- **<path\_to\_ccoctl\_output\_dir>** is the directory where the generated component credentials secrets will be placed.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

**Example output**

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-
machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-
machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-
alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...
```

**NOTE**

A RAM user can have up to two AccessKeys at the same time. If you run **ccoctl alibabacloud create-ram-users** more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

- b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

**Example output:**

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

5. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml
./<path_to_installation>dir>/manifests/
```

where:

**<path\_to\_ccoctl\_output\_dir>**

Specifies the directory created by the **ccoctl alibabacloud create-ram-users** command.

**<path\_to\_installation\_dir>**

Specifies the directory in which the installation program creates files.

### 4.3.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 4.3.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.

To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.

To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.

To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.3.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.3.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

#### Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https     reencrypt/Redirect    None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

### 4.3.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [About remote health monitoring](#) for more information about the Telemetry service

### 4.3.13. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 4.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Alibaba Cloud. To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

## NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

## IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

### 4.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

### 4.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Progress cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

#### 4.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

## Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.4.4.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

## Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.

- a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
- i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **alibabacloud** as the platform to target.
- iii. Select the region to deploy the cluster to.
- iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
- v. Provide a descriptive name for your cluster.
- vi. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**:

### Example install-config.yaml configuration file with credentialsMode set to Manual

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

1. Add this line to set the **credentialsMode** to **Manual**.
3. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.4.4.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

##### Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the directory in which the installation program creates files.

#### 4.4.4.3. Creating credentials for OpenShift Container Platform components with the **ccoctl** tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

### NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path\_to\_ccoctl\_output\_dir>** to refer to this directory.

##### Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (**access\_key\_id**) and AccessKeySecret (**access\_key\_secret**) of that RAM user into the [~/alibabacloud/credentials](#) file on your local computer.

##### Procedure

## Procedure

1. Set the **\$RELEASE\_IMAGE** variable by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
--credentials-requests \
--cloud=alibabacloud \
--to=<path_to_directory_with_list_of_credentials_requests>/credrequests \ 1
$RELEASE_IMAGE
```

- 1** **credrequests** is the directory where the list of **CredentialsRequest** objects is stored. This command creates the directory if it does not exist.

### NOTE

This command can take a few moments to run.

3. If your cluster uses cluster capabilities to disable one or more optional components, delete the **CredentialsRequest** custom resources for any disabled components.

### Example credrequests directory contents for OpenShift Container Platform 4.12 on Alibaba Cloud

```
0000_30_machine-api-operator_00_credentials-request.yaml 1
0000_50_cluster-image-registry-operator_01-registry-credentials-request-alibaba.yaml 2
0000_50_cluster-ingress-operator_00-ingress-credentials-request.yaml 3
0000_50_cluster-storage-operator_03_credentials_request_alibaba.yaml 4
```

- 1** The Machine API Operator CR is required.
- 2** The Image Registry Operator CR is required.
- 3** The Ingress Operator CR is required.
- 4** The Storage Operator CR is an optional component and might be disabled in your cluster.

4. Use the **ccoctl** tool to process all **CredentialsRequest** objects in the **credrequests** directory:

- a. Run the following command to use the tool:

```
$ ccoctl alibabacloud create-ram-users \
--name <name> \
--region=<alibaba_region> \
--credentials-requests-dir=
<path_to_directory_with_list_of_credentials_requests>/credrequests \
--output-dir=<path_to_ccoctl_output_dir>
```

where:

- **<name>** is the name used to tag any cloud resources that are created for tracking.
- **<alibaba\_region>** is the Alibaba Cloud region in which cloud resources will be created.
- **<path\_to\_directory\_with\_list\_of\_credentials\_requests>/credrequests** is the directory containing the files for the component **CredentialsRequest** objects.
- **<path\_to\_ccoctl\_output\_dir>** is the directory where the generated component credentials secrets will be placed.

#### NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

#### Example output

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-
machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-
machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-
alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...
```

#### NOTE

A RAM user can have up to two AccessKeys at the same time. If you run **ccoctl alibabacloud create-ram-users** more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

- Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

#### Example output:

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

5. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml
./<path_to_installation_dir>/manifests/
```

where:

**<path\_to\_ccoctl\_output\_dir>**

Specifies the directory created by the **ccoctl alibabacloud create-ram-users** command.

**<path\_to\_installation\_dir>**

Specifies the directory in which the installation program creates files.

#### 4.4.4.4. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 4.4.4.4.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.1. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

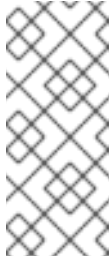

#### 4.4.4.4.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.2. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object   <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

#### 4.4.4.4.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.3. Optional parameters**

Parameter	Description	Values
<b>additionalTrustBundle</b>	<p>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</p>	String

Parameter	Description	Values
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or {}
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 20px; border: 1px solid black; margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 20px; border: 1px solid black; margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint, Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 50px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<p><b>Internal</b> or <b>External</b>. The default value is <b>External</b>.</p> <p>Setting this field to <b>Internal</b> is not supported on non-cloud platforms and IBM Cloud VPC.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>IMPORTANT</b></p> <p>If the value of the field is set to <b>Internal</b>, the cluster will become non-functional. For more information, refer to <a href="#">BZ#1953035</a>.</p> </div> </div>
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p> </div> </div>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.4.4.4.4. Additional Alibaba Cloud configuration parameters

Additional Alibaba Cloud configuration parameters are described in the following table. The **alibabacloud** parameters are the configuration used when installing on Alibaba Cloud. The **defaultMachinePlatform** parameters are the default configuration used when installing on Alibaba Cloud for machine pools that do not define their own platform configuration.

These parameters apply to both compute machines and control plane machines where specified.

#### NOTE

If defined, the parameters **compute.platform.alibabacloud** and **controlPlane.platform.alibabacloud** will overwrite **platform.alibabacloud.defaultMachinePlatform** settings for compute machines and control plane machines respectively.

Table 4.4. Optional Alibaba Cloud parameters

Parameter	Description	Values
<b>compute.platform.alibabacloud.imageID</b>	The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.	String.
<b>compute.platform.alibabacloud.instanceType</b>	InstanceType defines the ECS instance type. Example: <b>ecs.g6.large</b>	String.
<b>compute.platform.alibabacloud.systemDiskCategory</b>	Defines the category of the system disk. Examples: <b>cloud_efficiency,cloud_essd</b>	String.
<b>compute.platform.alibabacloud.systemDiskSize</b>	Defines the size of the system disk in gibibytes (GiB).	Integer.
<b>compute.platform.alibabacloud.zones</b>	The list of availability zones that can be used. Examples: <b>cn-hangzhou-h, cn-hangzhou-j</b>	String list.
<b>controlPlane.platform.alibabacloud.imageID</b>	The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.	String.
<b>controlPlane.platform.alibabacloud.instanceType</b>	InstanceType defines the ECS instance type. Example: <b>ecs.g6.xlarge</b>	String.
<b>controlPlane.platform.alibabacloud.systemDiskCategory</b>	Defines the category of the system disk. Examples: <b>cloud_efficiency,cloud_essd</b>	String.
<b>controlPlane.platform.alibabacloud.systemDiskSize</b>	Defines the size of the system disk in gibibytes (GiB).	Integer.
<b>controlPlane.platform.alibabacloud.zones</b>	The list of availability zones that can be used. Examples: <b>cn-hangzhou-h, cn-hangzhou-j</b>	String list.

Parameter	Description	Values
<b>platform.alibabacloud.region</b>	Required.The Alibaba Cloud region where the cluster will be created.	String.
<b>platform.alibabacloud.resourceGroupID</b>	The ID of an already existing resource group where the cluster will be installed. If empty, the installer will create a new resource group for the cluster.	String.
<b>platform.alibabacloud.tags</b>	Additional keys and values to apply to all Alibaba Cloud resources created for the cluster.	Object.
<b>platform.alibabacloud.vpcID</b>	The ID of an already existing VPC where the cluster should be installed. If empty, the installer will create a new VPC for the cluster.	String.
<b>platform.alibabacloud.vswitchIDs</b>	The ID list of already existing VSwitches where cluster resources will be created. The existing VSwitches can only be used when also using existing VPC. If empty, the installer will create new VSwitches for the cluster.	String list.
<b>platform.alibabacloud.defaultMachinePlatformImageID</b>	For both compute machines and control plane machines, the image ID that should be used to create ECS instance. If set, the image ID should belong to the same region as the cluster.	String.
<b>platform.alibabacloud.defaultMachinePlatformInstanceType</b>	For both compute machines and control plane machines, the ECS instance type used to create the ECS instance. Example: <b>ecs.g6.xlarge</b>	String.

Parameter	Description	Values
<b>platform.alibabacloud.defaultMachinePlatform.systemDiskCategory</b>	For both compute machines and control plane machines, the category of the system disk. Examples: <b>cloud_efficiency</b> , <b>cloud_essd</b> .	String, for example "", <b>cloud_efficiency</b> , <b>cloud_essd</b> .
<b>platform.alibabacloud.defaultMachinePlatform.systemDiskSize</b>	For both compute machines and control plane machines, the size of the system disk in gibibytes (GiB). The minimum is <b>120</b> .	Integer.
<b>platform.alibabacloud.defaultMachinePlatform.zones</b>	For both compute machines and control plane machines, the list of availability zones that can be used. Examples: <b>cn-hangzhou-h</b> , <b>cn-hangzhou-j</b>	String list.
<b>platform.alibabacloud.privateZoneID</b>	The ID of an existing private zone into which to add DNS records for the cluster's internal API. An existing private zone can only be used when also using existing VPC. The private zone must be associated with the VPC containing the subnets. Leave the private zone unset to have the installer create the private zone on your behalf.	String.

#### 4.4.4.5. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your cluster's platform or modify the values of the required parameters.

```

apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master

```

```

platform: {}
replicas: 3
metadata:
  creationTimestamp: null
  name: test-cluster ❶
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN ❷
  serviceNetwork:
    - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: ❸
      instanceType: ecs.g6.xlarge
      systemDiskCategory: cloud_efficiency
      systemDiskSize: 200
    region: ap-southeast-1 ❹
    resourceGroupID: rg-acfnw6j3hyai ❺
    vpcID: vpc-0xifdjerdibmaqvjob2b
    vswitchIDs: ❻
      - vsw-0xi8ycgwc8wv5rhviwdq5
      - vsw-0xiy6v3z2tedv009b4pz2
  publish: External
  pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }}' ❼
  sshKey: |
    ssh-rsa AAAA... ❽

```

- ❶ Required. The installation program prompts you for a cluster name.
- ❷ The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- ❸ Optional. Specify parameters for machine pools that do not define their own platform configuration.
- ❹ Required. The installation program prompts you for the region to deploy the cluster to.
- ❺ Optional. Specify an existing resource group where the cluster should be installed.
- ❼ Required. The installation program prompts you for the pull secret.
- ❽ Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
- ❻ Optional. These are example vswitchID values.

#### 4.4.4.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

## Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the

**trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

#### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

## NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 4.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### 4.4.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

##### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

##### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

##### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

##### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

##### Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### 4.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.4.10. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 4.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform 4.10, you can install a cluster on Alibaba Cloud with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#) .

### 4.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system**

namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

### 4.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 4.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform

components.

### 4.5.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

#### NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

#### IMPORTANT

The CIDR range **172.17.0.0/16** is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

#### Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

#### 4.5.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.

- a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
- i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Enter a descriptive name for your cluster.
  - iii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.5.5.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

#### Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the directory in which the installation program creates files.

**NOTE**

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path\_to\_ccoctl\_output\_dir>** to refer to this directory.

## Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

## Procedure

1. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
<1> `credrequests` is the directory where the list of `CredentialsRequest` objects is stored.
This command creates the directory if it does not exist.
```

**NOTE**

This command can take a few moments to run.

### 4.5.5.3. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### 4.5.5.3.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.5. Required parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

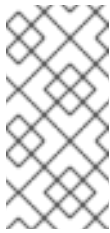

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.5.5.3.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.6. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 4.5.5.3.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.7. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.	<b>Enabled</b> or <b>Disabled</b>
	 <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	

Parameter	Description	Values
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or {}
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint, Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="486 584 592 1361" style="background-color: black; color: white; padding: 5px; margin-bottom: 10px;"> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> <div data-bbox="486 1406 592 1608" style="background-color: #f0f0f0; padding: 5px;"> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	<b>false</b> or <b>true</b>

Parameter	Description	Values
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<p><b>Internal</b> or <b>External</b>. The default value is <b>External</b>.</p> <p>Setting this field to <b>Internal</b> is not supported on non-cloud platforms and IBM Cloud VPC.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>If the value of the field is set to <b>Internal</b>, the cluster will become non-functional. For more information, refer to <a href="#">BZ#1953035</a>.</p> </div> </div>
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p> </div> </div>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.5.5.4. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your cluster's platform or modify the values of the required parameters.

```

apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:
  creationTimestamp: null
  name: test-cluster ❶
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN ❷
  serviceNetwork:
  - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: ❸
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
    region: ap-southeast-1 ❹
    resourceGroupID: rg-acfnw6j3hyai ❺
    vpcID: vpc-0xifdjerdibmaqvtjob2b
    vswitchIDs: ❻
    - vsw-0xi8ycgwc8wv5rhviwdq5
    - vsw-0xiy6v3z2tedv009b4pz2
  publish: External
  pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }}' ❼
  sshKey: |
    ssh-rsa AAAA... ❽

```

- ❶ Required. The installation program prompts you for a cluster name.
- ❷ The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- ❸ Optional. Specify parameters for machine pools that do not define their own platform configuration.

- 4 Required. The installation program prompts you for the region to deploy the cluster to.
- 5 Optional. Specify an existing resource group where the cluster should be installed.
- 7 Required. The installation program prompts you for the pull secret.
- 8 Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
- 6 Optional. These are example vswitchID values.

#### 4.5.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

#### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$. /openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 4.5.6. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

**clusterNetwork**

IP address pools from which pod IP addresses are allocated.

**serviceNetwork**

IP address pool for services.

### **defaultNetwork.type**

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

#### 4.5.6.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 4.8. Cluster Network Operator configuration object**

Field	Type	Description
<b>metadata.name</b>	<b>string</b>	The name of the CNO object. This name is always <b>cluster</b> .
<b>spec.clusterNetwork</b>	<b>array</b>	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:   - cidr: 10.128.0.0/19     hostPrefix: 23   - cidr: 10.128.32.0/19     hostPrefix: 23</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.serviceNetwork</b>	<b>array</b>	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:   - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.defaultNetwork</b>	<b>object</b>	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
<b>spec.kubeProxyConfig</b>	<b>object</b>	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

**defaultNetwork object configuration**

The values for the **defaultNetwork** object are defined in the following table:

**Table 4.9. defaultNetwork object**

Field	Type	Description
<b>type</b>	<b>string</b>	<p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
<b>openshiftSDNConfig</b>	<b>object</b>	This object is only valid for the OpenShift SDN cluster network provider.
<b>ovnKubernetesConfig</b>	<b>object</b>	This object is only valid for the OVN-Kubernetes cluster network provider.

**Configuration for the OpenShift SDN CNI cluster network provider**

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 4.10. openshiftSDNConfig object**

Field	Type	Description
<b>mode</b>	<b>string</b>	<p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>vxlanPort</b>	<b>integer</b>	<p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>

### Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 4.11. `ovnKubernetesConfig` object

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p>
<b>genevePort</b>	<b>integer</b>	The port to use for all Geneve packets. The default value is <b>6081</b> . This value cannot be changed after cluster installation.
<b>ipsecConfig</b>	<b>object</b>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<b>policyAuditConfig</b>	<b>object</b>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.
<b>gatewayConfig</b>	<b>object</b>	<p>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 1; padding-left: 10px;"> <p><b>NOTE</b></p> <p>While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.</p> </div> </div>

Table 4.12. **policyAuditConfig** object

Field	Type	Description
<b>rateLimit</b>	integer	The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second.
<b>maxFileSize</b>	integer	The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.

Field	Type	Description
<b>destination</b>	string	<p>One of the following additional audit log targets:</p> <p><b>libc</b> The libc <b>syslog()</b> function of the journald process on the host.</p> <p><b>udp:&lt;host&gt;:&lt;port&gt;</b> A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server.</p> <p><b>unix:&lt;file&gt;</b> A Unix Domain Socket file specified by <b>&lt;file&gt;</b>.</p> <p><b>null</b> Do not send the audit logs to any additional target.</p>
<b>syslogFacility</b>	string	The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .

Table 4.13. gatewayConfig object

Field	Type	Description
<b>routingViaHost</b>	<b>boolean</b>	<p>Set this field to <b>true</b> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <b>false</b>.</p> <p>This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <b>true</b>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</p>

### Example OVN-Kubernetes configuration with IPsec enabled

```

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}

```

### kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 4.14. kubeProxyConfig object

Field	Type	Description
<b>iptablesSyncPeriod</b>	<b>string</b>	<p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div>
<b>proxyArguments.iptables-min-sync-period</b>	<b>array</b>	<p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>

### 4.5.7. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

#### IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

#### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the `<installation_directory>/manifests/` directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

#### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

#### Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

### 4.5.8. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

#### IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

#### Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

## Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yaml** in the **<installation\_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yaml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  EOF
```

where:

**<installation\_directory>**

Specifies the directory name that contains the **manifests/** directory for your cluster.

3. Open the **cluster-network-03-config.yaml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

### Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
        hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- 1 Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.
- 2 Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

**NOTE**

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

**4.5.9. Deploying the cluster**

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

**Prerequisites**

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

**Procedure**

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```

...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

## NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 4.5.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### 4.5.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

##### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

##### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

##### Example output

```
system:admin
```

#### 4.5.12. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

##### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

## Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

## Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https    reencrypt/Redirect    None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

## 4.5.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 4.5.14. Next steps

- [Validate an installation.](#)

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 4.6. INSTALLING A CLUSTER ON ALIBABA CLOUD INTO AN EXISTING VPC

In OpenShift Container Platform version 4.10, you can install a cluster into an existing Alibaba Virtual Private Cloud (VPC) on Alibaba Cloud Services. The installation program provisions the required infrastructure, which can then be customized. To customize the VPC installation, modify the parameters in the 'install-config.yaml' file before you install the cluster.

### NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

### IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

### 4.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

### 4.6.2. Using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Virtual Private Cloud (VPC) in the Alibaba Cloud Platform. By deploying OpenShift Container Platform into an existing Alibaba VPC, you can avoid limit constraints in new accounts and more easily adhere to your

organization's operational constraints. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option. You must configure networking using vSwitches.

#### 4.6.2.1. Requirements for using your VPC

The union of the VPC CIDR block and the machine network CIDR must be non-empty. The vSwitches must be within the machine network.

The installation program does not create the following components:

- VPC
- vSwitches
- Route table
- NAT gateway

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

#### 4.6.2.2. VPC validation

To ensure that the vSwitches you provide are suitable, the installation program confirms the following data:

- All the vSwitches that you specify must exist.
- You have provided one or more vSwitches for control plane machines and compute machines.
- The vSwitches' CIDRs belong to the machine CIDR that you specified.

#### 4.6.2.3. Division of permissions

Some individuals can create different resources in your cloud than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components, such as VPCs or vSwitches.

#### 4.6.2.4. Isolation between clusters

If you deploy OpenShift Container Platform into an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed to the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 4.6.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.6.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

## Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

## Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 4.6.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

## Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.6.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

#### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **alibabacloud** as the platform to target.
- iii. Select the region to deploy the cluster to.
- iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
- v. Provide a descriptive name for your cluster.
- vi. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

- Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**:

#### Example **install-config.yaml** configuration file with **credentialsMode** set to **Manual**

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- Add this line to set the **credentialsMode** to **Manual**.

- Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
- Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.6.5.2. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 4.6.5.2.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.15. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.6.5.2.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.16. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 4.6.5.2.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.17. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.	<b>Enabled</b> or <b>Disabled</b>
	 <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	

Parameter	Description	Values
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or {}
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint, Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<p><b>fips</b></p>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="488 586 592 1361" style="background-color: black; color: white; padding: 5px; margin-bottom: 10px;"> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> <div data-bbox="488 1408 592 1603" style="background-color: black; color: white; padding: 5px;"> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	<p><b>false</b> or <b>true</b></p>

Parameter	Description	Values
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<p><b>Internal</b> or <b>External</b>. The default value is <b>External</b>.</p> <p>Setting this field to <b>Internal</b> is not supported on non-cloud platforms and IBM Cloud VPC.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>IMPORTANT</b></p> <p>If the value of the field is set to <b>Internal</b>, the cluster will become non-functional. For more information, refer to <a href="#">BZ#1953035</a>.</p> </div> </div>
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p> </div> </div>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.6.5.2.4. Additional Alibaba Cloud configuration parameters

Additional Alibaba Cloud configuration parameters are described in the following table. The

**alibabacloud** parameters are the configuration used when installing on Alibaba Cloud. The **defaultMachinePlatform** parameters are the default configuration used when installing on Alibaba Cloud for machine pools that do not define their own platform configuration.

These parameters apply to both compute machines and control plane machines where specified.

#### NOTE

If defined, the parameters **compute.platform.alibabacloud** and **controlPlane.platform.alibabacloud** will overwrite **platform.alibabacloud.defaultMachinePlatform** settings for compute machines and control plane machines respectively.

Table 4.18. Optional Alibaba Cloud parameters

Parameter	Description	Values
<b>compute.platform.alibabacloud.imageID</b>	The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.	String.
<b>compute.platform.alibabacloud.instanceType</b>	InstanceType defines the ECS instance type. Example: <b>ecs.g6.large</b>	String.
<b>compute.platform.alibabacloud.systemDiskCategory</b>	Defines the category of the system disk. Examples: <b>cloud_efficiency,cloud_essd</b>	String.
<b>compute.platform.alibabacloud.systemDiskSize</b>	Defines the size of the system disk in gibibytes (GiB).	Integer.
<b>compute.platform.alibabacloud.zones</b>	The list of availability zones that can be used. Examples: <b>cn-hangzhou-h, cn-hangzhou-j</b>	String list.
<b>controlPlane.platform.alibabacloud.imageID</b>	The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.	String.
<b>controlPlane.platform.alibabacloud.instanceType</b>	InstanceType defines the ECS instance type. Example: <b>ecs.g6.xlarge</b>	String.

Parameter	Description	Values
<b>controlPlane.platform.alibabacloud.systemDiskCategory</b>	Defines the category of the system disk. Examples: <b>cloud_efficiency,cloud_essd</b>	String.
<b>controlPlane.platform.alibabacloud.systemDisksize</b>	Defines the size of the system disk in gibibytes (GiB).	Integer.
<b>controlPlane.platform.alibabacloud.zones</b>	The list of availability zones that can be used. Examples: <b>cn-hangzhou-h, cn-hangzhou-j</b>	String list.
<b>platform.alibabacloud.region</b>	Required.The Alibaba Cloud region where the cluster will be created.	String.
<b>platform.alibabacloud.resourceGroupID</b>	The ID of an already existing resource group where the cluster will be installed. If empty, the installer will create a new resource group for the cluster.	String.
<b>platform.alibabacloud.tags</b>	Additional keys and values to apply to all Alibaba Cloud resources created for the cluster.	Object.
<b>platform.alibabacloud.vpcID</b>	The ID of an already existing VPC where the cluster should be installed. If empty, the installer will create a new VPC for the cluster.	String.
<b>platform.alibabacloud.vswitchIDs</b>	The ID list of already existing VSwitches where cluster resources will be created. The existing VSwitches can only be used when also using existing VPC. If empty, the installer will create new VSwitches for the cluster.	String list.

Parameter	Description	Values
<b>platform.alibabacloud.defaultMachinePlatform.imageID</b>	For both compute machines and control plane machines, the image ID that should be used to create ECS instance. If set, the image ID should belong to the same region as the cluster.	String.
<b>platform.alibabacloud.defaultMachinePlatform.instanceType</b>	For both compute machines and control plane machines, the ECS instance type used to create the ECS instance. Example: <b>ecs.g6.xlarge</b>	String.
<b>platform.alibabacloud.defaultMachinePlatform.systemDiskCategory</b>	For both compute machines and control plane machines, the category of the system disk. Examples: <b>cloud_efficiency</b> , <b>cloud_essd</b> .	String, for example "", <b>cloud_efficiency</b> , <b>cloud_essd</b> .
<b>platform.alibabacloud.defaultMachinePlatform.systemDiskSize</b>	For both compute machines and control plane machines, the size of the system disk in gibibytes (GiB). The minimum is <b>120</b> .	Integer.
<b>platform.alibabacloud.defaultMachinePlatform.zones</b>	For both compute machines and control plane machines, the list of availability zones that can be used. Examples: <b>cn-hangzhou-h</b> , <b>cn-hangzhou-j</b>	String list.
<b>platform.alibabacloud.privateZoneID</b>	The ID of an existing private zone into which to add DNS records for the cluster's internal API. An existing private zone can only be used when also using existing VPC. The private zone must be associated with the VPC containing the subnets. Leave the private zone unset to have the installer create the private zone on your behalf.	String.

#### 4.6.5.3. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your cluster's platform or modify the values of the required parameters.

```

apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:
  creationTimestamp: null
  name: test-cluster ❶
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN ❷
  serviceNetwork:
  - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: ❸
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
    region: ap-southeast-1 ❹
    resourceGroupID: rg-acfnw6j3hyai ❺
    vpcID: vpc-0xifdjerdibmaqvtbody2b
    vswitchIDs: ❻
    - vsw-0xi8ycgwc8wv5rhviwdq5
    - vsw-0xiy6v3z2tedv009b4pz2
  publish: External
  pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }}' ❼
  sshKey: |
    ssh-rsa AAAA... ❽

```

- ❶ Required. The installation program prompts you for a cluster name.
- ❷ The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- ❸ Optional. Specify parameters for machine pools that do not define their own platform configuration.

- 4 Required. The installation program prompts you for the region to deploy the cluster to.
- 5 Optional. Specify an existing resource group where the cluster should be installed.
- 7 Required. The installation program prompts you for the pull secret.
- 8 Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
- 6 Optional. These are example vswitchID values.

#### 4.6.5.4. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

##### Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the directory in which the installation program creates files.

#### 4.6.5.5. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

##### NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

##### Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).

##### Procedure

1. Obtain the OpenShift Container Platform release image:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Get the CCO container image from the OpenShift Container Platform release image:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator' $RELEASE_IMAGE)
```

**NOTE**

Ensure that the architecture of the **\$RELEASE\_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable:

```
$ chmod 775 ccoctl
```

**Verification**

- To verify that **ccoctl** is ready to use, display the help file:

```
$ ccoctl --help
```

**Output of ccoctl --help**

```
OpenShift credentials provisioning tool
```

```
Usage:
```

```
ccoctl [command]
```

```
Available Commands:
```

```
alibabacloud Manage credentials objects for alibaba cloud
```

```
aws          Manage credentials objects for AWS cloud
```

```
gcp          Manage credentials objects for Google cloud
```

```
help         Help about any command
```

```
ibmcloud     Manage credentials objects for IBM Cloud
```

```
Flags:
```

```
-h, --help  help for ccoctl
```

```
Use "ccoctl [command] --help" for more information about a command.
```

**4.6.5.6. Creating credentials for OpenShift Container Platform components with the ccoctl tool**

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

**NOTE**

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path\_to\_ccoctl\_output\_dir>** to refer to this directory.

**Prerequisites**

You must have:

- Extracted and prepared the **ccoctl** binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (**access\_key\_id**) and AccessKeySecret (**access\_key\_secret**) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.

## Procedure

1. Set the **\$RELEASE\_IMAGE** variable by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
--credentials-requests \
--cloud=alibabacloud \
--to=<path_to_directory_with_list_of_credentials_requests>/credrequests \ 1
$RELEASE_IMAGE
```

- 1** **credrequests** is the directory where the list of **CredentialsRequest** objects is stored. This command creates the directory if it does not exist.

### NOTE

This command can take a few moments to run.

3. If your cluster uses cluster capabilities to disable one or more optional components, delete the **CredentialsRequest** custom resources for any disabled components.

### Example **credrequests** directory contents for OpenShift Container Platform 4.12 on Alibaba Cloud

```
0000_30_machine-api-operator_00_credentials-request.yaml 1
0000_50_cluster-image-registry-operator_01-registry-credentials-request-alibaba.yaml 2
0000_50_cluster-ingress-operator_00-ingress-credentials-request.yaml 3
0000_50_cluster-storage-operator_03_credentials_request_alibaba.yaml 4
```

- 1** The Machine API Operator CR is required.
- 2** The Image Registry Operator CR is required.
- 3** The Ingress Operator CR is required.
- 4** The Storage Operator CR is an optional component and might be disabled in your cluster.

4. Use the **ccoctl** tool to process all **CredentialsRequest** objects in the **credrequests** directory:

- a. Run the following command to use the tool:

```
$ ccoctl alibabacloud create-ram-users \
--name <name> \
--region=<alibaba_region> \
--credentials-requests-dir=
<path_to_directory_with_list_of_credentials_requests>/credrequests \
--output-dir=<path_to_ccoctl_output_dir>
```

where:

- **<name>** is the name used to tag any cloud resources that are created for tracking.
- **<alibaba\_region>** is the Alibaba Cloud region in which cloud resources will be created.
- **<path\_to\_directory\_with\_list\_of\_credentials\_requests>/credrequests** is the directory containing the files for the component **CredentialsRequest** objects.
- **<path\_to\_ccoctl\_output\_dir>** is the directory where the generated component credentials secrets will be placed.

#### NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

#### Example output

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-
machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-
machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-
alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...
```

#### NOTE

A RAM user can have up to two AccessKeys at the same time. If you run **ccoctl alibabacloud create-ram-users** more than twice, the previous generated manifests secret becomes stale and you must reapply the newly generated secrets.

- b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

-

**Example output:**

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

5. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml
./<path_to_installation>dir/manifests/
```

where:

**<path\_to\_ccoctl\_output\_dir>**

Specifies the directory created by the **ccoctl alibabacloud create-ram-users** command.

**<path\_to\_installation\_dir>**

Specifies the directory in which the installation program creates files.

### 4.6.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**4.6.7. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

## Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.

To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.6.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.6.9. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

### 4.6.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console

#### 4.6.11. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 4.7. UNINSTALLING A CLUSTER ON ALIBABA CLOUD

You can remove a cluster that you deployed to Alibaba Cloud.

### 4.7.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

#### NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

#### Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

#### Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$ ./openshift-install destroy cluster \
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

1. Optional: Delete the **<installation\_directory>** directory and the OpenShift Container Platform installation program.

## CHAPTER 5. INSTALLING ON AWS

### 5.1. PREPARING TO INSTALL ON AWS

#### 5.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 5.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See [Configuring an AWS account](#) for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for AWS](#) for other options, including [configuring the Cloud Credential Operator \(CCO\) to use the Amazon Web Services Security Token Service \(AWS STS\)](#).

#### 5.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- [Installing a cluster quickly on AWS](#) You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- [Installing a customized cluster on AWS](#) You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- [Installing a cluster on AWS with network customizations](#) You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- [Installing a cluster on AWS in a restricted network](#) You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the

installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.

- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.
- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

### 5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.
- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

### 5.1.4. Next steps

- [Configuring an AWS account](#)

## 5.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

### 5.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.

**NOTE**

If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see [Registering Domain Names Using Amazon Route 53](#) in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See [Making Amazon Route 53 the DNS Service for an Existing Domain](#) in the AWS documentation.
3. Create a public hosted zone for your domain or subdomain. See [Creating a Public Hosted Zone](#) in the AWS documentation.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. Extract the new authoritative name servers from the hosted zone records. See [Getting the Name Servers for a Public Hosted Zone](#) in the AWS documentation.
5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: [Adding or Changing Name Servers or Glue Records](#).
6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See [Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain](#) in the AWS documentation for an example high level procedure.

### 5.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses **us-gov-west-1** region for Route53 and tagging API clients.

The Ingress Operator uses <https://tagging.us-gov-west-1.amazonaws.com> as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the [Service Endpoints](#) in the AWS documentation about GovCloud (US).

**IMPORTANT**

Private, disconnected installations are not supported for AWS GovCloud when you install in the **us-gov-east-1** region.

### Example Route 53 configuration

```
platform:
aws:
  region: us-gov-west-1
  serviceEndpoints:
  - name: ec2
    url: https://ec2.us-gov-west-1.amazonaws.com
  - name: elasticloadbalancing
    url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
  - name: route53
```

```
url: https://route53.us-gov.amazonaws.com 1
- name: tagging
url: https://tagging.us-gov-west-1.amazonaws.com 2
```

- 1** Route 53 defaults to <https://route53.us-gov.amazonaws.com> for both AWS GovCloud (US) regions.
- 2** Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

## 5.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default [Service Limits](#) affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of clusters available by default	Default AWS limit	Description
Instance Limits	Varies	Varies	<p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>● One bootstrap machine, which is removed after installation</li> <li>● Three control plane nodes</li> <li>● Three worker nodes</li> </ul> <p>These instance type counts are within a new account's default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.</p> <p>In most regions, the worker machines use an <b>m6i.large</b> instance and the bootstrap and control plane machines use <b>m6i.xlarge</b> instances. In some regions, including all regions that do not support these instance types, <b>m5.large</b> and <b>m5.xlarge</b> instances are used instead.</p>

Component	Number of clusters available by default	Default AWS limit	Description
Elastic IPs (EIPs)	0 to 1	5 EIPs per account	<p>To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each <a href="#">availability zone within a region</a>. Each private subnet requires a <a href="#">NAT Gateway</a>, and each NAT gateway requires a separate <a href="#">elastic IP</a>. Review the <a href="#">AWS region map</a> to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit.</p> <div style="display: flex; align-items: flex-start; margin-top: 10px;">  <div> <p><b>IMPORTANT</b></p> <p>To use the <b>us-east-1</b> region, you must increase the EIP limit for your account.</p> </div> </div>
Virtual Private Clouds (VPCs)	5	5 VPCs per region	Each cluster creates its own VPC.
Elastic Load Balancing (ELB/NLB)	3	20 per region	By default, each cluster creates internal and external network load balancers for the master API server and a single Classic Load Balancer for the router. Deploying more Kubernetes <b>Service</b> objects with type <b>LoadBalancer</b> will create additional <a href="#">load balancers</a> .
NAT Gateways	5	5 per availability zone	The cluster deploys one NAT gateway in each availability zone.
Elastic Network Interfaces (ENIs)	At least 12	350 per region	<p>The default installation creates 21 ENIs and an ENI for each availability zone in your region. For example, the <b>us-east-1</b> region contains six availability zones, so a cluster that is deployed in that zone uses 27 ENIs. Review the <a href="#">AWS region map</a> to determine how many availability zones are in each region.</p> <p>Additional ENIs are created for additional machines and ELB load balancers that are created by cluster usage and deployed workloads.</p>

Component	Number of clusters available by default	Default AWS limit	Description
VPC Gateway	20	20 per account	Each cluster creates a single VPC Gateway for S3 access.
S3 buckets	99	100 buckets per account	Because the installation process creates a temporary bucket and the registry component in each cluster creates a bucket, you can create only 99 OpenShift Container Platform clusters per AWS account.
Security Groups	250	2,500 per account	Each cluster creates 10 distinct security groups.

### 5.2.3. Required AWS permissions for the IAM user

#### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

#### Example 5.1. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**

- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**

- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

#### Example 5.2. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

#### NOTE

If you use an existing VPC, your account does not require these permissions for creating network resources.

#### Example 5.3. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**

- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 5.4. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

### Example 5.5. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

#### NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

### Example 5.6. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**

- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 5.7. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 5.8. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 5.9. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3:DeleteObject**
- **s3>ListBucketVersions**
- **tag:GetResources**

Example 5.10. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**

- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

#### Example 5.11. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

#### Example 5.12. Additional IAM and S3 permissions that are required to create manifests

- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam:ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3:ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 5.13. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

**5.2.4. Creating an IAM user**

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the [Creating an IAM User in Your AWS Account](#) procedure in the AWS documentation, set the following options:

**Procedure**

1. Specify the IAM user name and select **Programmatic access**.
2. Attach the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

**NOTE**

While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.
4. Confirm that the user name that you specified is granted the **AdministratorAccess** policy.
5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.

**IMPORTANT**

You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials.

## Additional resources

- See [Manually creating IAM for AWS](#) for steps to set the Cloud Credential Operator (CCO) to manual mode prior to installation. Use this mode in environments where the cloud identity and access management (IAM) APIs are not reachable, or if you prefer not to store an administrator-level credential secret in the cluster **kube-system** project.

### 5.2.5. IAM Policies and AWS authentication

By default, the installation program creates instance profiles for the bootstrap, control plane, and compute instances with the necessary permissions for the cluster to operate.

However, you can create your own IAM roles and specify them as part of the installation process. You might need to specify your own roles to deploy the cluster or to manage the cluster after installation. For example:

- Your organization's security policies require that you use a more restrictive set of permissions to install the cluster.
- After the installation, the cluster is configured with an Operator that requires access to additional services.

If you choose to specify your own IAM roles, you can take the following steps:

- Begin with the default policies and adapt as required. For more information, see "Default permissions for IAM instance profiles".
- Use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template that is based on the cluster's activity. For more information see, "Using AWS IAM Analyzer to create policy templates".

#### 5.2.5.1. Default permissions for IAM instance profiles

By default, the installation program creates IAM instance profiles for the bootstrap, control plane and worker instances with the necessary permissions for the cluster to operate.

The following lists specify the default permissions for control plane and compute machines:

##### Example 5.14. Default IAM role permissions for control plane instance profiles

- **ec2:AttachVolume**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteVolume**
- **ec2:Describe\***
- **ec2:DetachVolume**

- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyVolume**
- **ec2:RevokeSecurityGroupIngress**
- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerPolicy**
- **elasticloadbalancing:CreateLoadBalancerListeners**
- **elasticloadbalancing:CreateTargetGroup**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>DeleteListener**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing>DeleteLoadBalancerListeners**
- **elasticloadbalancing>DeleteTargetGroup**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:Describe\***
- **elasticloadbalancing:DetachLoadBalancerFromSubnets**
- **elasticloadbalancing:ModifyListener**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:RegisterTargets**
- **elasticloadbalancing:SetLoadBalancerPoliciesForBackendServer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**
- **kms:DescribeKey**

**Example 5.15. Default IAM role permissions for compute instance profiles**

- **ec2:DescribeInstances**
- **ec2:DescribeRegions**

**5.2.5.2. Specifying an existing IAM role**

Instead of allowing the installation program to create IAM instance profiles with the default permissions, you can use the **install-config.yaml** file to specify an existing IAM role for control plane and compute instances.

**Prerequisites**

- You have an existing **install-config.yaml** file.

**Procedure**

1. Update **compute.platform.aws.iamRole** with an existing role for the control plane machines.

**Sample install-config.yaml file with an IAM role for compute instances**

```
compute:
  - hyperthreading: Enabled
    name: worker
  platform:
    aws:
      iamRole: ExampleRole
```

2. Update **controlPlane.platform.aws.iamRole** with an existing role for the compute machines.

**Sample install-config.yaml file with an IAM role for control plane instances**

```
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      iamRole: ExampleRole
```

3. Save the file and reference it when installing the OpenShift Container Platform cluster.

**Additional resources**

- See [Deploying the cluster](#).

**5.2.5.3. Using AWS IAM Analyzer to create policy templates**

The minimal set of permissions that the control plane and compute instance profiles require depends on how the cluster is configured for its daily operation.

One way to determine which permissions the cluster instances require is to use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template:

- A policy template contains the permissions the cluster has used over a specified period of time.
- You can then use the template to create policies with fine-grained permissions.

## Procedure

The overall process could be:

1. Ensure that CloudTrail is enabled. CloudTrail records all of the actions and events in your AWS account, including the API calls that are required to create a policy template. For more information, see the AWS documentation for [working with CloudTrail](#).
2. Create an instance profile for control plane instances and an instance profile for compute instances. Be sure to assign each role a permissive policy, such as PowerUserAccess. For more information, see the AWS documentation for [creating instance profile roles](#).
3. Install the cluster in a development environment and configure it as required. Be sure to deploy all of applications the cluster will host in a production environment.
4. Test the cluster thoroughly. Testing the cluster ensures that all of the required API calls are logged.
5. Use the IAM Access Analyzer to create a policy template for each instance profile. For more information, see the AWS documentation for [generating policies based on the CloudTrail logs](#).
6. Create and add a fine-grained policy to each instance profile.
7. Remove the permissive policy from each instance profile.
8. Deploy a production cluster using the existing instance profiles with the new policies.

### NOTE

You can add [IAM Conditions](#) to your policy to make it more restrictive and compliant with your organization security requirements.

## 5.2.6. Supported AWS Marketplace regions

Installing an OpenShift Container Platform cluster using an AWS Marketplace image is available to customers who purchase the offer in North America.

While the offer must be purchased in North America, you can deploy the cluster to any of the following supported partitions:

- Public
- GovCloud

### NOTE

Deploying a OpenShift Container Platform cluster using an AWS Marketplace image is not supported for the AWS secret regions or China regions.

## 5.2.7. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following regions.

### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

### 5.2.7.1. AWS public regions

The following AWS public regions are supported:

- **af-south-1** (Cape Town)
- **ap-east-1** (Hong Kong)
- **ap-northeast-1** (Tokyo)
- **ap-northeast-2** (Seoul)
- **ap-northeast-3** (Osaka)
- **ap-south-1** (Mumbai)
- **ap-southeast-1** (Singapore)
- **ap-southeast-2** (Sydney)
- **ca-central-1** (Central)
- **eu-central-1** (Frankfurt)
- **eu-north-1** (Stockholm)
- **eu-south-1** (Milan)
- **eu-west-1** (Ireland)
- **eu-west-2** (London)
- **eu-west-3** (Paris)
- **me-south-1** (Bahrain)
- **sa-east-1** (São Paulo)
- **us-east-1** (N. Virginia)
- **us-east-2** (Ohio)
- **us-west-1** (N. California)
- **us-west-2** (Oregon)

### 5.2.7.2. AWS GovCloud regions

The following AWS GovCloud regions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

### 5.2.7.3. AWS C2S Secret region

The **us-iso-east-1** region is supported.

### 5.2.7.4. AWS China regions

The following AWS China regions are supported:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

## 5.2.8. Next steps

- Install an OpenShift Container Platform cluster:
  - [Quickly install a cluster](#) with default options on installer-provisioned infrastructure
  - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
  - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

## 5.3. MANUALLY CREATING IAM FOR AWS

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

### 5.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use the Amazon Web Services Security Token Service**  
You can use the CCO utility (**ccoctl**) to configure the cluster to use the Amazon Web Services Security Token Service (AWS STS). When the CCO utility is used to configure the cluster for STS, it assigns IAM roles that provide short-term, limited-privilege security credentials to components.

**NOTE**

This credentials strategy is supported for only new OpenShift Container Platform clusters and must be configured during installation. You cannot reconfigure an existing cluster that uses a different credentials strategy to use this feature.

- **Manage cloud credentials manually.**

You can set the **credentialsMode** parameter for the CCO to **Manual** to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**

If you are using the CCO with the **credentialsMode** parameter set to **Mint**, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

**Additional resources**

- To learn how to use the CCO utility (**ccoctl**) to configure the CCO to use the AWS STS, see [Using manual mode with STS](#).
- To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see [Rotating or removing cloud provider credentials](#).
- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

**5.3.2. Manually create IAM**

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

### Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
  --credentials-requests \
  --cloud=aws
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
```

```

apiVersion: cloudcredential.openshift.io/v1
kind: AWSProviderSpec
statementEntries:
- effect: Allow
  action:
  - iam:GetUser
  - iam:GetUserPolicy
  - iam:ListAccessKeys
  resource: "*"
...

```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample CredentialsRequest object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
    - effect: Allow
      action:
      - s3:CreateBucket
      - s3>DeleteBucket
      resource: "*"
    ...
  secretRef:
    name: <component-secret>
    namespace: <component-namespace>
...

```

### Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component-secret>
  namespace: <component-namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

## IMPORTANT

The release image includes **CredentialsRequest** objects for Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set. You can identify these objects by their use of the **release.openshift.io/feature-gate: TechPreviewNoUpgrade** annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.
- If you are using any of these features, you must create secrets for the corresponding objects.

- To find **CredentialsRequest** objects with the **TechPreviewNoUpgrade** annotation, run the following command:

```
$ grep "release.openshift.io/feature-gate" *
```

### Example output

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate:
TechPreviewNoUpgrade
```

7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir <installation_directory>
```

## IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

### Additional resources

- [Updating a cluster using the web console](#)
- [Updating a cluster using the CLI](#)

### 5.3.3. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform on platforms that support it. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the **admin** credential is stored in the **kube-system** namespace and then used by the CCO to process the **CredentialsRequest** objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires

- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires **admin** credential storage in a cluster **kube-system** secret.

### 5.3.4. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all **CredentialsRequest** objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

#### NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

### 5.3.5. Next steps

- Install an OpenShift Container Platform cluster:
  - [Installing a cluster quickly on AWS](#) with default options on installer-provisioned infrastructure
  - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
  - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

## 5.4. INSTALLING A CLUSTER QUICKLY ON AWS

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

### 5.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.

- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#). Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

## 5.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **aws** as the platform to target.
- c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- d. Select the AWS region to deploy the cluster to.
- e. Select the base domain for the Route 53 service that you configured for your cluster.
- f. Enter a descriptive name for your cluster.
- g. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

...

```

INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

#### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

#### NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

#### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

### 5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

## Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

## 5.4.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

### Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https      reencrypt/Redirect      None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 5.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.4.10. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 5.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

### 5.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **`./openshift-install gather`** command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 5.5.4. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

### Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

### Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

### Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239 1
      type: m5.4xlarge
    replicas: 3
  metadata:
    name: test-cluster
  platform:
    aws:
      region: us-east-2 2
  sshKey: ssh-ed25519 AAAA...
  pullSecret: '{"auths": ...}'
```

- 1 The AMI ID from your AWS Marketplace subscription.

- 2

Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your

### 5.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```

$ ./openshift-install create install-config --dir <installation_directory> 1

```

- 1 For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 5.5.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 5.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.1. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object

Parameter	Description	Values
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.2. Network parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:   - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

### 5.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.3. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

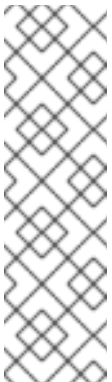

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>controlPlane.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<p><b>credentialsMode</b></p>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="486 517 595 864" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p> </div> <div data-bbox="486 913 595 1261" style="border: 1px solid black; padding: 5px;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p> </div>	<p><b>Mint, Passthrough, Manual</b> or an empty string ("").</p>

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.5.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.4. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b> When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.5.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.5. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.5.6.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.16. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 5.5.6.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

### Example 5.17. Machine types based on 64-bit ARM architecture

- **c6g.\***
- **m6g.\***

#### 5.5.6.5. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
    rootVolume:
      iops: 4000
      size: 500
      type: io1 6
      type: m6i.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
        type: c5.4xlarge
      zones:
      - us-west-2c
    replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23

```

```

machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
aws:
region: us-west-2 11
userTags:
adminContact: jdoe
costCenter: 7536
amiID: ami-96c6f8f7 12
serviceEndpoints: 13
- name: ec2
url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
fips: false 14
sshKey: ssh-ed25519 AAAA... 15
pullSecret: '{"auths": ...}' 16

```

- 1 10 11 16** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12** The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 13** The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

- 14 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 15 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 5.5.6.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
```

```
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.5.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

## Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

## Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https    reencrypt/Redirect    None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

## Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.5.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.5.12. Next steps

- [Validating an installation.](#)

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 5.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### 5.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.

- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.6.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

#### NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

#### IMPORTANT

The CIDR range **172.17.0.0/16** is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

## Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 5.6.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

**5.6.6.1. Installation configuration parameters**

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

## 5.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.6. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.6.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.7. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <div style="margin-left: 20px;"> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

### 5.6.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.8. Optional parameters**

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String

Parameter	Description	Values
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>controlPlane.hypertreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 512 595 862" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <div data-bbox="485 909 595 1258" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="486 584 592 1361" style="background-color: black; color: white; padding: 5px;"> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> <div data-bbox="486 1406 592 1603" style="background-color: #f0f0f0; padding: 5px;"> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.

Parameter	Description	Values
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.6.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.9. Optional AWS parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .

Parameter	Description	Values
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b>  When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .

Parameter	Description	Values
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.6.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.10. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.6.6.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.18. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 5.6.6.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.19. Machine types based on 64-bit ARM architecture**

- **c6g.\***
- **m6g.\***

**5.6.6.5. Sample customized install-config.yaml file for AWS**

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
        type: m6i.xlarge
      replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
        type: c5.4xlarge
      zones:
      - us-west-2c
      replicas: 3
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23

```

```

machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
aws:
region: us-west-2 12
userTags:
adminContact: jdoe
costCenter: 7536
amiID: ami-96c6f8f7 13
serviceEndpoints: 14
- name: ec2
url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
fips: false 15
sshKey: ssh-ed25519 AAAA... 16
pullSecret: '{"auths": ...}' 17

```

- 1 10 12 17 Required. The installation program prompts you for this value.
- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7 11 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

- 15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 5.6.6.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.6.7. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

#### **clusterNetwork**

IP address pools from which pod IP addresses are allocated.

#### **serviceNetwork**

IP address pool for services.

#### **defaultNetwork.type**

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

#### 5.6.7.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 5.11. Cluster Network Operator configuration object**

Field	Type	Description
<b>metadata.name</b>	<b>string</b>	The name of the CNO object. This name is always <b>cluster</b> .
<b>spec.clusterNetwork</b>	<b>array</b>	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:   - cidr: 10.128.0.0/19     hostPrefix: 23   - cidr: 10.128.32.0/19     hostPrefix: 23</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>

Field	Type	Description
<b>spec.serviceNetwork</b>	<b>array</b>	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:   - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.defaultNetwork</b>	<b>object</b>	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
<b>spec.kubeProxyConfig</b>	<b>object</b>	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

#### defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 5.12. defaultNetwork object

Field	Type	Description
<b>type</b>	<b>string</b>	<p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
<b>openshiftSDNConfig</b>	<b>object</b>	This object is only valid for the OpenShift SDN cluster network provider.
<b>ovnKubernetesConfig</b>	<b>object</b>	This object is only valid for the OVN-Kubernetes cluster network provider.

#### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 5.13. openshiftSDNConfig object

Field	Type	Description
<b>mode</b>	<b>string</b>	<p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>vxlanPort</b>	<b>integer</b>	<p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>

### Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 5.14. `ovnKubernetesConfig` object

Field	Type	Description
<code>mtu</code>	<code>integer</code>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p>
<code>genevePort</code>	<code>integer</code>	The port to use for all Geneve packets. The default value is <b>6081</b> . This value cannot be changed after cluster installation.
<code>ipsecConfig</code>	<code>object</code>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<code>policyAuditConfig</code>	<code>object</code>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.
<code>gatewayConfig</code>	<code>object</code>	<p>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 1; padding-left: 10px;"> <p><b>NOTE</b></p> <p>While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.</p> </div> </div>

Table 5.15. `policyAuditConfig` object

Field	Type	Description
<code>rateLimit</code>	<code>integer</code>	The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second.

Field	Type	Description
<b>maxFileSize</b>	integer	The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.
<b>destination</b>	string	One of the following additional audit log targets:  <b>libc</b> The libc <b>syslog()</b> function of the journald process on the host. <b>udp:&lt;host&gt;:&lt;port&gt;</b> A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server. <b>unix:&lt;file&gt;</b> A Unix Domain Socket file specified by <b>&lt;file&gt;</b> . <b>null</b> Do not send the audit logs to any additional target.
<b>syslogFacility</b>	string	The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .

Table 5.16. gatewayConfig object

Field	Type	Description
<b>routingViaHost</b>	<b>boolean</b>	Set this field to <b>true</b> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <b>false</b> .  This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <b>true</b> , you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.

### Example OVN-Kubernetes configuration with IPsec enabled

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

### kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 5.17. kubeProxyConfig object

Field	Type	Description
<b>iptablesSyncPeriod</b>	<b>string</b>	<p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div>
<b>proxyArguments.iptables-min-sync-period</b>	<b>array</b>	<p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>

### 5.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

#### IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

#### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

1 **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

#### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

#### Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

#### NOTE

For more information on using a Network Load Balancer (NLB) on AWS, see [Configuring Ingress cluster traffic on AWS using a Network Load Balancer](#).

### 5.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

#### Prerequisites

- Create the **install-config.yaml** file and complete any modifications to it.

## Procedure

Create an Ingress Controller backed by an AWS NLB on a new cluster.

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation\_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- 1 For **<installation\_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

### Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  creationTimestamp: null
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      scope: External
      providerParameters:
        type: AWS
      aws:
        type: NLB
    type: LoadBalancerService
```

4. Save the **cluster-ingress-default-ingresscontroller.yaml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-ingress-default-ingresscontroller.yaml** file. The installation program deletes the **manifests/** directory when creating the cluster.

## 5.6.10. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

### IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

### Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

where:

**<installation\_directory>**

Specifies the directory name that contains the **manifests/** directory for your cluster.

- Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

### Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
```

```
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
          hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- 1 Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.
- 2 Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

#### NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

#### NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

### 5.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

#### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version in the **Version** drop-down menu.
- Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
- Unpack the archive:

```
$ tar xvf <file>
```

- Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

## Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

### Example output

```
system:admin
```

## 5.6.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

## Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

### Example output

```
-
```

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 5.6.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

## 5.6.16. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 5.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

### 5.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

### IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

### NOTE

If you are configuring a proxy, be sure to also review this site list.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## 5.7.2. About installations in restricted networks

In OpenShift Container Platform 4.10, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift image registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet

your restrictions.

### 5.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 5.7.3. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.7.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.

- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkAclAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

### 5.7.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

### 5.7.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.7.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

## 5.7.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.7.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1** Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the **imageContentSources** values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

#### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.

- iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to give the additional information that is required for an installation in a restricted network.
- a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<mirror_host_name>:5000": {"auth": "<credentials>","email":
"you@example.com"}}}'
```

For **<mirror\_host\_name>**, specify the registry domain name that you specified in the certificate for your mirror registry, and for **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  //////////////////////////////////////////////////////////////////////////////////////////////////////////////////
  -----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry. The certificate file can be an existing, trusted certificate authority, or the self-signed certificate that you generated for the mirror registry.

- c. Define the subnets for the VPC to install the cluster in:

```
subnets:
- subnet-1
- subnet-2
- subnet-3
```

- d. Add the image content resources, which resemble the following YAML excerpt:

```
imageContentSources:
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
  source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
  source: registry.redhat.io/ocp/release
```

For these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 5.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 5.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.18. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .

Parameter	Description	Values
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.19. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:   - cidr: 10.128.0.0/14     hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:   - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:   - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

### 5.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.20. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hypertreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 50px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.7.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.21. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b> When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.7.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.22. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.7.6.3. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5

```

- 1 10 11 Required. The installation program prompts you for this value.
- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

## IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Progress cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 For **<local\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.
- 19 Provide the contents of the certificate file that you used for your mirror registry.
- 20 Provide the **imageContentSources** section from the output of the command to mirror the repository.

#### 5.7.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

## Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that can be used to verify HTTPS connections. The OpenShift Container Platform

that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

#### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

#### NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version in the **Version** drop-down menu.
- Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
- Unpack the archive:

```
$ tar xvf <file>
```

- Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.7.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.7.10. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

#### Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
  -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

#### TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

### 5.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.7.12. Next steps

- [Validate an installation.](#)

- [Customize your cluster](#).
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#).
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#).

## 5.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

In OpenShift Container Platform version 4.10, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.8.2. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

### 5.8.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- Create a public and private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet. For an example of this type of configuration, see [VPC with public and private subnets \(NAT\)](#) in the AWS documentation.  
Record each subnet ID. Completing the installation requires that you enter these values in the **platform** section of the **install-config.yaml** file. See [Finding a subnet ID](#) in the AWS documentation.
- The VPC's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.

- The VPC must have a public internet gateway attached to it. For each availability zone:
  - The public subnet requires a route to the internet gateway.
  - The public subnet requires a NAT gateway with an EIP address.
  - The private subnet requires a route to the NAT gateway in public subnet.
- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkAclAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

### 5.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

### 5.8.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 5.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 5.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 5.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 5.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.23. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object

Parameter	Description	Values
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.24. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:   - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

### 5.8.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.25. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>controlPlane.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 510 595 862" style="border: 1px solid gray; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> <div data-bbox="485 909 595 1261" style="border: 1px solid gray; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 50px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String

Parameter	Description	Values
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.8.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.26. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<code>compute.platform.aws.rootVolume.iops</code>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<code>compute.platform.aws.rootVolume.size</code>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<code>compute.platform.aws.rootVolume.type</code>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<code>compute.platform.aws.rootVolume.kmsKeyARN</code>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<code>compute.platform.aws.type</code>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <a href="#">Supported AWS machine types</a> table that follows.
<code>compute.platform.aws.zones</code>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<code>compute.aws.region</code>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b>  When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<code>controlPlane.platform.aws.amiID</code>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <a href="#">RHCOS AMIs for AWS infrastructure</a> for available AMI IDs.

Parameter	Description	Values
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.8.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.27. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.8.6.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.20. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 5.8.6.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

### Example 5.21. Machine types based on 64-bit ARM architecture

- **c6g.\***
- **m6g.\***

#### 5.8.6.5. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1

- subnet-2
- subnet-3
amiID: ami-96c6f8f7 13
serviceEndpoints: 14
- name: ec2
url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KVV 15
fips: false 16
sshKey: ssh-ed25519 AAAA... 17
pullSecret: '{"auths": ...}' 18

```

- 1 10 11 18** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 5.8.6.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

**1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

**2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation\_directory>/.openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.8.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.8.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.8.12. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 5.9. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.10, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## 5.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 5.9.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 5.9.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

### 5.9.3. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.9.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.

Component	AWS type	Description												
Public subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCElasticGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NATGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkACL</b></li> <li>● <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.												

### 5.9.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

### 5.9.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.9.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

## 5.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

Identity added: /home/<you>/<path>/<file\_name> (<computer\_name>)

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 5.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 5.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

## Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

### NOTE

You must name this configuration file **install-config.yaml**.

### NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation\_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

### 5.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for

the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

## NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### 5.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.28. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .

Parameter	Description	Values
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 5.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.29. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	<p>Object</p>  <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p>

Parameter	Description	Values
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation. For example, <b>10.0.0.0/16</b> .  <b>NOTE</b> Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.

### 5.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.30. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . See <i>Supported installation methods for different platforms</i> in <i>Installing</i> documentation for information about instance availability.	String
<b>controlPlane.hypertreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="488 589 592 1361" style="background-color: black; width: 100%; height: 100%; position: relative;">  </div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> <div data-bbox="488 1413 592 1608" style="background-color: black; width: 100%; height: 100%; position: relative;">  </div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String

Parameter	Description	Values
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.9.7.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.31. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<code>compute.platform.aws.rootVolume.iops</code>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<code>compute.platform.aws.rootVolume.size</code>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<code>compute.platform.aws.rootVolume.type</code>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<code>compute.platform.aws.rootVolume.kmsKeyARN</code>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<code>compute.platform.aws.type</code>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <a href="#">Supported AWS machine types</a> table that follows.
<code>compute.platform.aws.zones</code>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<code>compute.aws.region</code>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b>  When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<code>controlPlane.platform.aws.amiID</code>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.9.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.32. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.9.7.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.22. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 5.9.7.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.23. Machine types based on 64-bit ARM architecture**

- **c6g.\***
- **m6g.\***

**5.9.7.5. Sample customized install-config.yaml file for AWS**

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
        type: m6i.xlarge
      replicas: 3
compute: 7
  - hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
        type: c5.4xlarge
      zones:
      - us-west-2c
      replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
  hostPrefix: 23

```

```

publish: Internal 18
pullSecret: '{"auths": ...}' 19

```

- 1 10 11 19 Required. The installation program prompts you for this value.
- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 5.9.7.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.9.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

**1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

**2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.9.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.9.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.9.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.9.13. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 5.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) into a government region. To configure the region, modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.10.2. AWS government regions

OpenShift Container Platform supports deploying a cluster to an [AWS GovCloud \(US\)](#) region.

The following AWS GovCloud partitions are supported:

- **us-gov-east-1**
- **us-gov-west-1**

### 5.10.3. Installation requirements

Before you can install the cluster, you must:

- Provide an existing private AWS VPC and subnets to host the cluster. Public zones are not supported in Route 53 in AWS GovCloud. As a result, clusters must be private when you deploy to an AWS government region.
- Manually create the installation configuration file (**install-config.yaml**).

### 5.10.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

#### NOTE

Public zones are not supported in Route 53 in an AWS GovCloud Region. Therefore, clusters must be private if they are deployed to an AWS GovCloud Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

#### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.

- The hosts on the network that you provision.
- The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

#### 5.10.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

##### 5.10.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

#### 5.10.5. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

##### 5.10.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag.  
The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.  
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- **ec2.<region>.amazonaws.com**

- `elasticloadbalancing.<region>.amazonaws.com`
- `s3.<region>.amazonaws.com`

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description								
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.								
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.								
Internet gateway	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::InternetGateway</b></li> <li>• <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>• <b>AWS::EC2::RouteTable</b></li> <li>• <b>AWS::EC2::Route</b></li> <li>• <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>• <b>AWS::EC2::NatGateway</b></li> <li>• <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.								
Network access control	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::NetworkACL</b></li> <li>• <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic
Port	Reason									
<b>80</b>	Inbound HTTP traffic									
<b>443</b>	Inbound HTTPS traffic									
<b>22</b>	Inbound SSH traffic									

Component	AWS type	Description	
		<b>1024 - 65535</b>	Inbound ephemeral traffic
		<b>0 - 65535</b>	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

### 5.10.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

### 5.10.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 5.10.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 5.10.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 5.10.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

Agent pid 31874

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.10.8. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

#### Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

#### Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

#### Sample **install-config.yaml** file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
platform:
aws:
  amiID: ami-06c4d345f7c207239 1
  type: m5.4xlarge
```

```

replicas: 3
metadata:
  name: test-cluster
platform:
  aws:
    region: us-east-2 2
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'

```

- 1 The AMI ID from your AWS Marketplace subscription.
- 2 Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

### 5.10.9. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.10.10. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

- Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

- Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 5.10.10.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for

the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

## NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### 5.10.10.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.33. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .

Parameter	Description	Values
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.10.10.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.34. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	<p>Object</p>  <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p>

Parameter	Description	Values
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation. For example, <b>10.0.0.0/16</b> .  <b>NOTE</b> Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.

### 5.10.10.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.35. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hypertreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="486 510 595 862" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <div data-bbox="486 907 595 1258" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.10.10.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.36. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <a href="#">Supported AWS machine types</a> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b> When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.10.10.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.37. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.10.10.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.24. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 5.10.10.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.25. Machine types based on 64-bit ARM architecture**

- **c6g.\***
- **m6g.\***

**5.10.10.5. Sample customized install-config.yaml file for AWS**

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-gov-west-1a
      - us-gov-west-1b
      rootVolume:

pullSecret: '{"auths": ...}' 19

```

1 10 11 19 Required.

- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 5.10.10.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$. /openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.10.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$. /openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

**1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

**2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

## NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.10.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.10.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.10.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.10.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.10.16. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 5.11. INSTALLING A CLUSTER ON AWS INTO A TOP SECRET REGION

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) into a Commercial Cloud Services (C2S) Top Secret Region. To configure the region, modify parameters in the `install config.yaml` file before you install the cluster.

### 5.11.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multifactor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.11.2. AWS Top Secret Region

OpenShift Container Platform supports deploying a cluster to an [AWS Commercial Cloud Services \(C2S\) Top Secret Region](#).

The C2S Top Secret Region does not have a published Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Images (AMI) to select, so you must upload a custom AMI that belongs to that region.

The following AWS Top Secret Region partition is supported:

- **us-iso-east-1**

#### NOTE

The maximum supported MTU in an AWS Top Secret Region is not the same as AWS commercial. For more information about configuring MTU during installation, see the *Cluster Network Operator configuration object* section in *Installing a cluster on AWS with network customizations*

### 5.11.3. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image for the AWS Top Secret Region.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (**install-config.yaml**).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

#### IMPORTANT

You must also define a custom CA certificate in the **additionalTrustBundle** field of the **install-config.yaml** file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the **AWS\_CA\_BUNDLE** environment variable, or define the CA bundle in the **ca\_bundle** field of the AWS config file.

### 5.11.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

**NOTE**

Public zones are not supported in Route 53 in an AWS Top Secret Region. Therefore, clusters must be private if they are deployed to an AWS Top Secret Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

**IMPORTANT**

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

#### 5.11.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

##### 5.11.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

### 5.11.5. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.11.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.

- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- A cluster in a Top Secret Region is unable to reach the public IP addresses for the EC2 and ELB endpoints. You must create a VPC endpoint and attach it to the subnet that the clusters are using. Name the endpoints as follows:
  - **elasticloadbalancing.<region>.c2s.ic.gov**
  - **ec2.<region>.c2s.ic.gov**
  - **s3.<region>.c2s.ic.gov**

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkAclAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCElasticGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

### 5.11.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

### 5.11.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.11.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 5.11.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.11.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

1 1 1 The RHCOS VMDK version, like **4.10.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos- $\{RHCOS\_VERSION\}$ -x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": " $\{VMIMPORT\_BUCKET\_NAME\}$ ",
    "S3Key": "rhcos- $\{RHCOS\_VERSION\}$ -x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region  $\{AWS\_DEFAULT\_REGION\}$  \
  --description "<description>" \ 1
  --disk-container "file://<file_path>/containers.json" 2
```

1 The description of your RHCOS disk being imported, like **rhcos- $\{RHCOS\_VERSION\}$ -x86\_64-aws.x86\_64**.

2 The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region  $\{AWS\_DEFAULT\_REGION\}$ 
```

### Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 3
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
  {DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' 4
```

- 1 The RHCOS VMDK architecture type, like **x86\_64**, **s390x**, or **ppc64le**.
- 2 The **Description** from the imported snapshot.
- 3 The name of the RHCOS AMI.
- 4 The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

### 5.11.8. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 5.11.9. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform

components.

### 5.11.10. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

#### Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 5.11.10.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**5.11.10.1.1. Required configuration parameters**

Required installation configuration parameters are described in the following table:

**Table 5.38. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .

Parameter	Description	Values
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.11.10.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.39. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:   - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

### 5.11.10.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.40. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>

Parameter	Description	Values
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hypertreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 510 595 862" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> <div data-bbox="485 907 595 1258" style="border: 1px solid black; padding: 5px;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 100%; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 100%; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.11.10.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 5.41. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <a href="#">Supported AWS machine types</a> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .   <b>IMPORTANT</b> When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability map</a> in the AWS documentation.
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.

Parameter	Description	Values
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.

Parameter	Description	Values
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

### 5.11.10.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.26. Machine types based on 64-bit x86 architecture for secret regions

- **c4.\***
- **c5.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **r4.\***
- **r5.\***
- **t3.\***

### 5.11.10.3. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

## IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-iso-east-1a
      - us-iso-east-1b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m6i.xlarge
  replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
      - us-iso-east-1a
      - us-iso-east-1b
      replicas: 3
  metadata:
    name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-iso-east-1 11
  userTags:
    adminContact: jdoe
    costCenter: 7536
  subnets: 12

```

```

- subnet-1
- subnet-2
- subnet-3
amiID: ami-96c6f8f7 13 14
serviceEndpoints: 15
  - name: ec2
    url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KVV 16
fips: false 17
sshKey: ssh-ed25519 AAAA... 18
publish: Internal 19
pullSecret: '{"auths": ...}' 20
additionalTrustBundle: | 21
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----

```

1 10 11 13 20 Required.

- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Red Hat Operators reference* content.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 14 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 15 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

- 16 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.
- 21 The custom CA certificate. This is required when deploying to the AWS C2S Top Secret Region because the AWS API requires a custom CA trust bundle.

#### 5.11.10.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.11.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

#### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

#### NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

## 5.11.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

-

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.11.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.11.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.11.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.11.16. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 5.12. INSTALLING A CLUSTER ON AWS CHINA

In OpenShift Container Platform version 4.10, you can install a cluster to the following Amazon Web Services (AWS) China regions:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

### 5.12.1. Prerequisites

- You have an Internet Content Provider (ICP) license.
- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

### 5.12.2. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) for the AWS China regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (**install-config.yaml**).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

### 5.12.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.12.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network.

### NOTE

AWS China does not support a VPN connection between the VPC and your network. For more information about the Amazon VPC service in the Beijing and Ningxia regions, see [Amazon Virtual Private Cloud](#) in the AWS China documentation.

#### 5.12.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

##### 5.12.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

### 5.12.5. About using a custom VPC

In OpenShift Container Platform 4.10, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 5.12.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.

- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- **ec2.<region>.amazonaws.com.cn**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCElasticGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

### 5.12.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

### 5.12.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

### 5.12.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 5.12.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.12.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

#### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

#### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

- 1 The AWS profile name that holds your AWS credentials, like **beijingadmin**.

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

- 1 The AWS region, like **cn-north-1**.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

- 1 The RHCOS VMDK version, like **4.10.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos- $\{RHCOS\_VERSION\}$ -x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": " $\{VMIMPORT\_BUCKET\_NAME\}$ ",
    "S3Key": "rhcos- $\{RHCOS\_VERSION\}$ -x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region  $\{AWS\_DEFAULT\_REGION\}$  \
  --description "<description>" 1 \
  --disk-container "file://<file_path>/containers.json" 2
```

- 1 The description of your RHCOS disk being imported, like **rhcos- $\{RHCOS\_VERSION\}$ -x86\_64-aws.x86\_64**.

- 2 The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region  $\{AWS\_DEFAULT\_REGION\}$ 
```

## Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 1 \
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" 2 \
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" 3 \
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs={DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' 4
```

- 1** The RHCOS VMDK architecture type, like **x86\_64**, **s390x**, or **ppc64le**.
- 2** The **Description** from the imported snapshot.
- 3** The name of the RHCOS AMI.
- 4** The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

### 5.12.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.12.9. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

#### Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

### NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 5.12.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 5.12.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.42. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

## 5.12.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.43. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object   <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

### 5.12.9.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 5.44. Optional parameters**

Parameter	Description	Values
<b>additionalTrustBundle</b>	<p>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</p>	String

Parameter	Description	Values
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="485 1384 592 1702" data-label="Image"> </div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or {}
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint, Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 20px;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<p><b>Internal</b> or <b>External</b>. The default value is <b>External</b>.</p> <p>Setting this field to <b>Internal</b> is not supported on non-cloud platforms and IBM Cloud VPC.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>IMPORTANT</b></p> <p>If the value of the field is set to <b>Internal</b>, the cluster will become non-functional. For more information, refer to <a href="#">BZ#1953035</a>.</p> </div> </div>
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p> </div> </div>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

### 5.12.9.2. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
name: master
platform:
  aws:
```

```

zones:
- cn-north-1a
- cn-north-1b
rootVolume:
  iops: 4000
  size: 500
  type: io1 6
  type: m6i.xlarge
replicas: 3
compute: 7
- hyperthreading: Enabled 8
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
    type: c5.4xlarge
    zones:
      - cn-north-1a
    replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: cn-north-1 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: 12
    - subnet-1
    - subnet-2
    - subnet-3
    amiID: ami-96c6f8f7 13 14
    serviceEndpoints: 15
    - name: ec2
      url: https://vpce-id.ec2.cn-north-1.vpce.amazonaws.com.cn
    hostedZone: Z3URY6TWQ91KVV 16
  fips: false 17
  sshKey: ssh-ed25519 AAAA... 18
  publish: Internal 19
  pullSecret: '{"auths": ...}' 20

```

**1** **10** **11** **13** **20** Required.

- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 14 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 15 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 16 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19** How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

### 5.12.9.3. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.45. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.12.9.4. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.27. Machine types based on 64-bit x86 architecture**

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

**5.12.9.5. Tested instance types for AWS on 64-bit ARM infrastructures**

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

**Example 5.28. Machine types based on 64-bit ARM architecture**

- **c6g.\***
- **m6g.\***

### 5.12.9.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

#### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com.cn**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.12.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/./openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 5.12.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.12.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 5.12.13. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

- List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

**Example output**

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

- Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### 5.12.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [About remote health monitoring](#) for more information about the Telemetry service.

#### 5.12.15. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 5.13. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) that uses infrastructure that you provide.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

#### 5.13.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or UNIX\)](#) in the AWS documentation.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

### NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

#### 5.13.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.13.3. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

### 5.13.3.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 5.46. Minimum required hosts**

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

### IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.4, or RHEL 8.5.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

### 5.13.3.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.47. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 5.13.3.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.29. Machine types based on 64-bit x86 architecture

- c4.\*
- c5.\*
- c5a.\*
- i3.\*
- m4.\*
- m5.\*
- m5a.\*
- m6i.\*
- r4.\*
- r5.\*
- r5a.\*
- r6i.\*
- t3.\*
- t3a.\*

#### 5.13.3.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.30. Machine types based on 64-bit ARM architecture

- c6g.\*
- m6g.\*

#### 5.13.3.5. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using

kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

#### 5.13.4. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

##### 5.13.4.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description										
VPC	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::VPC</b></li> <li>● <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.										
Public subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.										
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.										
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkACL</b></li> <li>● <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic
Port	Reason											
<b>80</b>	Inbound HTTP traffic											
<b>443</b>	Inbound HTTPS traffic											
<b>22</b>	Inbound SSH traffic											
<b>1024 - 65535</b>	Inbound ephemeral traffic											

Component	AWS type	Description	
		<b>0 - 65535</b>	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

### Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api.<cluster\_name>.<domain>** must point to the external load balancer, and an entry for **api-int.<cluster\_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	<b>AWS::Route53::HostedZone</b>	The hosted zone for your internal DNS.
etcd record sets	<b>AWS::Route53::RecordSet</b>	The registration records for etcd for your control plane machines.
Public load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your public subnets.
External API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the external API server.
External listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the external load balancer.

Component	AWS type	Description
External target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the external load balancer.
Private load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your private subnets.
Internal API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the internal API server.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 22623 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.

## Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
<b>MasterSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>6443</b>
		<b>tcp</b>	<b>22623</b>

Group	Type	IP Protocol	Port range
<b>WorkerSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
<b>BootstrapSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>19531</b>

## Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>MasterIngressEtcd</b>	etcd	<b>tcp</b>	<b>2379- 2380</b>
<b>MasterIngressVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>MasterIngressWorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>MasterIngressInternal</b>	Internal cluster communication and Kubernetes proxy metrics	<b>tcp</b>	<b>9000 - 9999</b>
<b>MasterIngressWorkerInternal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>MasterIngressKube</b>	Kubernetes kubelet, scheduler and controller manager	<b>tcp</b>	<b>10250 - 10259</b>
<b>MasterIngressWorkerKube</b>	Kubernetes kubelet, scheduler and controller manager	<b>tcp</b>	<b>10250 - 10259</b>
<b>MasterIngressIngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>MasterIngressWorkerIngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>MasterIngressGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>

Ingress group	Description	IP protocol	Port range
<b>MasterIngress WorkerGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>MasterIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress WorkerIpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>MasterIngress WorkerIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>MasterIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress WorkerIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress WorkerInternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress IngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>MasterIngress WorkerIngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress Vxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress WorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress Internal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress WorkerInternal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress Kube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress WorkerKube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress IngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress WorkerIngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress Geneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress MasterGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress MasterIpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>WorkerIngress MasterIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress MasterIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress MasterInternal UDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress IngressServices UDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>WorkerIngress MasterIngress ServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	<b>Allow</b>	<b>ec2:*</b>	<b>*</b>
	<b>Allow</b>	<b>elasticloadbalancing :*</b>	<b>*</b>
	<b>Allow</b>	<b>iam:PassRole</b>	<b>*</b>
	<b>Allow</b>	<b>s3:GetObject</b>	<b>*</b>
Worker	<b>Allow</b>	<b>ec2:Describe*</b>	<b>*</b>
Bootstrap	<b>Allow</b>	<b>ec2:Describe*</b>	<b>*</b>

Role	Effect	Action	Resource
	<b>Allow</b>	<b>ec2:AttachVolume</b>	*
	<b>Allow</b>	<b>ec2:DetachVolume</b>	*

### 5.13.4.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

### 5.13.4.3. Required AWS permissions for the IAM user

#### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

#### Example 5.31. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2>CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**

- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**

- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 5.32. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 5.33. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**

- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 5.34. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

**Example 5.35. Required IAM permissions for installation**

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

**Example 5.36. Required Route 53 permissions for installation**

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**

- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 5.37. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 5.38. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 5.39. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3:DeleteObject**
- **s3>ListBucketVersions**
- **tag:GetResources**

Example 5.40. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**

- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

#### Example 5.41. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

#### Example 5.42. Additional IAM and S3 permissions that are required to create manifests

- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam:ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3:ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 5.43. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

### 5.13.5. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

**Prerequisites**

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

**Procedure**

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. If you use the CloudFormation template to deploy your worker nodes, you must update the **worker0.type.properties.ImageID** parameter with this value.

### 5.13.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.13.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Progress cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

## 5.13.8. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

### 5.13.8.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

## Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.10.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> ❶
      partitions:
        - label: var
          start_mib: <partition_start_offset> ❷
          size_mib: <partition_size> ❸
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
```

```
format: xfs
mount_options: [defaults, prjquota] 4
with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

#### NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 5.13.8.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

#### Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

### NOTE

The AWS access key ID and secret access key are stored in **~/.aws/credentials** in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
- v. Select the base domain for the Route 53 service that you configured for your cluster.
- vi. Enter a descriptive name for your cluster.
- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

- Optional: Back up the **install-config.yaml** file.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

### 5.13.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

### Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
```

```
noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

#### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.13.8.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

## IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

## Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

```
1. Open the <installation_directory>/manifests/cluster-scheduler-02-config.yml file
```

- a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
  - b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
  - c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: ❶
    id: mycluster-100419-private-zone
  publicZone: ❷
    id: example.openshift.com
status: {}
```

- ❶ ❷ Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> ❶
```

- ❶ For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The `kubeadmin-password` and `kubeconfig` files are created in the `./<installation_directory>/auth` directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

### 5.13.9. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

## Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

## Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

## Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

### 5.13.10. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

-

```
[
  {
    "ParameterKey": "VpcCidr", 1
    "ParameterValue": "10.0.0.0/16" 2
  },
  {
    "ParameterKey": "AvailabilityZoneCount", 3
    "ParameterValue": "1" 4
  },
  {
    "ParameterKey": "SubnetBits", 5
    "ParameterValue": "12" 6
  }
]
```

- 1** The CIDR block for the VPC.
  - 2** Specify a CIDR block in the format **x.x.x.x/16-24**.
  - 3** The number of availability zones to deploy the VPC in.
  - 4** Specify an integer between **1** and **3**.
  - 5** The size of each subnet in each availability zone.
  - 6** Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.
2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>VpcId</b>	The ID of your VPC.
<b>PublicSubnetIds</b>	The IDs of the new public subnets.
<b>PrivateSubnetIds</b>	The IDs of the new private subnets.

### 5.13.10.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

#### Example 5.44. CloudFormation template for the VPC

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.)\{3\}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\/(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number
  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number
```

## Metadata:

    ]

```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

### 5.13.11. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of

AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1** For the **<route53\_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

## Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  },
  {
    "ParameterKey": "InfrastructureName", 3
    "ParameterValue": "mycluster-<random_string>" 4
  },
]
```

```

{
  "ParameterKey": "HostedZoneId", 5
  "ParameterValue": "<random_string>" 6
},
{
  "ParameterKey": "HostedZoneName", 7
  "ParameterValue": "example.com" 8
},
{
  "ParameterKey": "PublicSubnets", 9
  "ParameterValue": "subnet-<random_string>" 10
},
{
  "ParameterKey": "PrivateSubnets", 11
  "ParameterValue": "subnet-<random_string>" 12
},
{
  "ParameterKey": "VpcId", 13
  "ParameterValue": "vpc-<random_string>" 14
}
]

```

- 1 A short, representative cluster name to use for hostnames, etc.
- 2 Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
- 3 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 4 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 5 The Route 53 public zone ID to register the targets with.
- 6 Specify the Route 53 public zone ID, which as a format similar to **Z21IXYZABCZ2A4**. You can obtain this value from the AWS console.
- 7 The Route 53 zone to register the targets with.
- 8 Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 9 The public subnets that you created for your VPC.
- 10 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 11 The private subnets that you created for your VPC.
- 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
- 13 The VPC that you created for the cluster.

- 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

### IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>PrivateHostedZoneId</b>	Hosted zone ID for the private DNS.
<b>ExternalApiLoadBalancerName</b>	Full name of the external API load balancer.
<b>InternalApiLoadBalancerName</b>	Full name of the internal API load balancer.
<b>ApiServerDnsName</b>	Full hostname of the API server.
<b>RegisterNLbpTargetsLambda</b>	Lambda ARN useful to help register/deregister IP targets for these load balancers.
<b>ExternalApiTargetGroupArn</b>	ARN of external API target group.
<b>InternalApiTargetGroupArn</b>	ARN of internal API target group.
<b>InternalServiceTargetGroupArn</b>	ARN of internal service target group.

### 5.13.11.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

#### Example 5.45. CloudFormation template for the network and load balancers

AWSTemplateFormatVersion: [2010-09-09](#)

Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:

ClusterName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: [27](#)

MinLength: [1](#)

ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of [27](#) characters.

Description: A short, representative cluster name to use for host names and other identifying

names.

Type: String

InfrastructureName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

HostedZoneld:

Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.

Type: String

HostedZoneName:

Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.

Type: String

Default: "example.com"

PublicSubnets:

Description: The internet-facing subnets.

Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:

Description: The internal subnets.

Type: List<AWS::EC2::Subnet::Id>

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: AWS::EC2::VPC::Id

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- ClusterName

- InfrastructureName

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- PublicSubnets

- PrivateSubnets

- Label:

default: "DNS"

Parameters:

- HostedZoneName

- HostedZoneld

ParameterLabels:

ClusterName:

default: "Cluster Name"

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

```

PublicSubnets:
  default: "Public Subnets"
PrivateSubnets:
  default: "Private Subnets"
HostedZoneName:
  default: "Public Hosted Zone Name"
HostedZoneId:
  default: "Public Hosted Zone ID"

```

## Resources:

```

ExtApiElb:
  Type: AWS::ElasticLoadBalancingV2::LoadBalancer
  Properties:
    Name: !Join ["-", [!Ref InfrastructureName, "ext"]]
    IpAddressType: ipv4
    Subnets: !Ref PublicSubnets
    Type: network

```

## IntApiElb:

```

Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:
  Name: !Join ["-", [!Ref InfrastructureName, "int"]]
  Scheme: internal
  IpAddressType: ipv4
  Subnets: !Ref PrivateSubnets
  Type: network

```

## IntDns:

```

Type: "AWS::Route53::HostedZone"
Properties:
  HostedZoneConfig:
    Comment: "Managed by CloudFormation"
  Name: !Join [".", [!Ref ClusterName, !Ref HostedZoneName]]
  HostedZoneTags:
    - Key: Name
      Value: !Join ["-", [!Ref InfrastructureName, "int"]]
    - Key: !Join [ "", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
      Value: "owned"
  VPCs:
    - VPCId: !Ref Vpclid
      VPCRegion: !Ref "AWS::Region"

```

## ExternalApiServerRecord:

```

Type: AWS::Route53::RecordSetGroup
Properties:
  Comment: Alias record for the API server
  HostedZoneId: !Ref HostedZoneId
  RecordSets:
    - Name:
        !Join [
          ".",
          ["api", !Ref ClusterName, !Join [ "", [!Ref HostedZoneName, "."]]],
        ]
      Type: A
      AliasTarget:
        HostedZoneId: !GetAtt ExtApiElb.CanonicalHostedZoneID

```

DNSName: !GetAtt ExtApiElb.DNSName

InternalApiServerRecord:

Type: AWS::Route53::RecordSetGroup

Properties:

Comment: Alias record for the API server

HostedZoneId: !Ref IntDns

RecordSets:

- Name:

```
!Join [
  ":",
  ["api", !Ref ClusterName, !Join ["", [!Ref HostedZoneName, "."]]],
]
```

Type: A

AliasTarget:

HostedZoneId: !GetAtt IntApiElb.CanonicalHostedZoneID

DNSName: !GetAtt IntApiElb.DNSName

- Name:

```
!Join [
  ":",
  ["api-int", !Ref ClusterName, !Join ["", [!Ref HostedZoneName, "."]]],
]
```

Type: A

AliasTarget:

HostedZoneId: !GetAtt IntApiElb.CanonicalHostedZoneID

DNSName: !GetAtt IntApiElb.DNSName

ExternalApiListener:

Type: AWS::ElasticLoadBalancingV2::Listener

Properties:

event['ResourceProperties']['InfrastructureName']+event['ResourceProperties']['Subnets'][0])
    Runtime: "python3.7"
    Timeout: 120

```

```

RegisterPublicSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PublicSubnets

```

```

RegisterPrivateSubnetTags:
  Type: Custom::SubnetRegister
  Properties:
    ServiceToken: !GetAtt RegisterSubnetTags.Arn
    InfrastructureName: !Ref InfrastructureName
    Subnets: !Ref PrivateSubnets

```

```

Outputs:
  PrivateHostedZoneId:
    Description: Hosted zone ID for the private DNS, which is required for private records.
    Value: !Ref IntDns
  ExternalApiLoadBalancerName:
    Description: Full name of the external API load balancer.
    Value: !GetAtt ExtApiElb.LoadBalancerFullName
  InternalApiLoadBalancerName:
    Description: Full name of the internal API load balancer.
    Value: !GetAtt IntApiElb.LoadBalancerFullName
  ApiServerDnsName:
    Description: Full hostname of the API server, which is required for the Ignition config files.
    Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]
  RegisterNlbIpTargetsLambda:
    Description: Lambda ARN useful to help register or deregister IP targets for these load
balancers.
    Value: !GetAtt RegisterNlbIpTargets.Arn
  ExternalApiTargetGroupArn:

```

Description: ARN of the external API target group.  
 Value: !Ref ExternalApiTargetGroup  
 InternalApiTargetGroupArn:  
 Description: ARN of the internal API target group.  
 Value: !Ref InternalApiTargetGroup  
 InternalServiceTargetGroupArn:  
 Description: ARN of the internal service target group.  
 Value: !Ref InternalServiceTargetGroup

## IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

## Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- You can view details about your hosted zones by navigating to the [AWS Route 53 console](#).
- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

## 5.13.12. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

- You created and configured a VPC and associated subnets in AWS.

## Procedure

- Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "VpcCidr", 3
    "ParameterValue": "10.0.0.0/16" 4
  },
  {
    "ParameterKey": "PrivateSubnets", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "VpcId", 7
    "ParameterValue": "vpc-<random_string>" 8
  }
]
```

- 1** The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 2** Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 3** The CIDR block for the VPC.
  - 4** Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
  - 5** The private subnets that you created for your VPC.
  - 6** Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 7** The VPC that you created for the cluster.
  - 8** Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
  - Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>MasterSecurityGroupID</b>	Master Security Group ID
<b>WorkerSecurityGroupID</b>	Worker Security Group ID
<b>MasterInstanceProfile</b>	Master IAM Instance Profile
<b>WorkerInstanceProfile</b>	Worker IAM Instance Profile

### 5.13.12.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

#### Example 5.46. CloudFormation template for security objects

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^(((0-9)|1-9|0-9|10-9){2}|20-4|0-9|250-5))\.\.){3}((0-9)|1-9|0-9|10-9){2}|20-
    4|0-9|250-5)(\v(1[6-9]|20-4))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  PrivateSubnets:
    Description: The internal subnets.
    Type: List<AWS::EC2::Subnet::Id>

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Cluster Information"
        Parameters:
          - InfrastructureName
      - Label:
          default: "Network Configuration"
        Parameters:
          - VpcId
          - VpcCidr
          - PrivateSubnets
    ParameterLabels:
      InfrastructureName:
        default: "Infrastructure Name"
      VpcId:
        default: "VPC ID"
      VpcCidr:
        default: "VPC CIDR"
      PrivateSubnets:
        default: "Private Subnets"

```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

### 5.13.13. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

#### Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
  - Print the current **x86\_64** or **aarch64** AMI for an AWS region, such as **us-west-1**:

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

#### Example output

```
ami-0d3e625f84626bbda
```

The output of this command is the AWS AMI ID for your designated architecture and the **us-west-1** region. The AMI must belong to the same region as the cluster.

### 5.13.14. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.

#### NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 5.48. x86\_64 RHCOS AMIs

#### 5.13.14.1. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you can upload a custom AMI prior to installing the cluster.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI,

the installation program copies the **us-east-1** AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the **install-config.yaml** file.

### 5.13.14.2. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

#### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

#### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

1 1 1 The RHCOS VMDK version, like **4.10.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
```

```
"UserBucket": {
  "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
  "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
}
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" \ 1
  --disk-container "file://<file_path>/containers.json" 2
```

- 1** The description of your RHCOS disk being imported, like **rhcos-\${RHCOS\_VERSION}-x86\_64-aws.x86\_64**.
- 2** The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

### Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
```

```

--ena-support \
--name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❸
--virtualization-type hvm \
--root-device-name '/dev/xvda' \
--block-device-mappings 'DeviceName=/dev/xvda,Ebs=
{DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' ❹

```

- ❶ The RHCOS VMDK architecture type, like **x86\_64**, **s390x**, or **ppc64le**.
- ❷ The **Description** from the imported snapshot.
- ❸ The name of the RHCOS AMI.
- ❹ The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

### 5.13.15. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

#### NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

#### Procedure

1. Provide a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster's region and upload the Ignition config file to it.

**IMPORTANT**

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

**IMPORTANT**

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the **s3://** schema.

**NOTE**

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

- a. Create the bucket:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1** **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

- b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-  
infra/bootstrap.ign 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

**Example output**

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[  
  {  
    "ParameterKey": "InfrastructureName", 1  
    "ParameterValue": "mycluster-<random_string>" 2  
  },  
]
```

```

{
  "ParameterKey": "RhcosAmi", 3
  "ParameterValue": "ami-<random_string>" 4
},
{
  "ParameterKey": "AllowedBootstrapSshCidr", 5
  "ParameterValue": "0.0.0.0/0" 6
},
{
  "ParameterKey": "PublicSubnet", 7
  "ParameterValue": "subnet-<random_string>" 8
},
{
  "ParameterKey": "MasterSecurityGroupIid", 9
  "ParameterValue": "sg-<random_string>" 10
},
{
  "ParameterKey": "VpcIid", 11
  "ParameterValue": "vpc-<random_string>" 12
},
{
  "ParameterKey": "BootstrapIgnitionLocation", 13
  "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
},
{
  "ParameterKey": "AutoRegisterELB", 15
  "ParameterValue": "yes" 16
},
{
  "ParameterKey": "RegisterNlbPTargetsLambdaArn", 17
  "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbPTargets-<random_string>" 18
},
{
  "ParameterKey": "ExternalApiTargetGroupArn", 19
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
},
{
  "ParameterKey": "InternalApiTargetGroupArn", 21
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
},
{
  "ParameterKey": "InternalServiceTargetGroupArn", 23
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
}
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.
- 4 Specify a valid **AWS::EC2::Image::Id** value.
- 5 CIDR block to allow SSH access to the bootstrap node.
- 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
- 7 The public subnet that is associated with your VPC to launch the bootstrap node into.
- 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 9 The master security group ID (for registering temporary rules)
- 10 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 11 The VPC created resources will belong to.
- 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- 13 Location to fetch bootstrap Ignition config file from.
- 14 Specify the S3 bucket and file name in the form **s3://<bucket\_name>/bootstrap.ign**.
- 15 Whether or not to register a network load balancer (NLB).
- 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 17 The ARN for NLB IP target registration lambda group.
- 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 19 The ARN for external API load balancer target group.
- 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 21 The ARN for internal API load balancer target group.
- 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 23 The ARN for internal service load balancer target group.
- 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

- Copy the template from the **CloudFormation template for the bootstrap machines** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
- Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- <name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- <template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- <parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>Bootstrap InstanceId</b>	The bootstrap Instance ID.
<b>Bootstrap PublicIp</b>	The bootstrap node public IP address.
<b>Bootstrap PrivateIp</b>	The bootstrap node private IP address.

### 5.13.15.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

#### Example 5.47. CloudFormation template for the bootstrap machine

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AllowedBootstrapSshCidr:
    AllowedPattern: ^((([0-9]{1-9}[0-9]{1-9}|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.)\.)\{3\}([0-9]{1-9}|1[0-9]{2}|2[0-
    4][0-9]|25[0-5])(\V([0-9]{1-9}|2[0-9]|3[0-2]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
    Default: 0.0.0.0/0
    Description: CIDR block to allow SSH access to the bootstrap node.
    Type: String
  PublicSubnet:
    Description: The public subnet to launch the bootstrap node into.
    Type: AWS::EC2::Subnet::Id
  MasterSecurityGroupId:
    Description: The master security group ID for registering temporary rules.
    Type: AWS::EC2::SecurityGroup::Id
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  BootstrapIgnitionLocation:
    Default: s3://my-s3-bucket/bootstrap.ign
    Description: Ignition config file location.
    Type: String
  AutoRegisterELB:
    Default: "yes"
    AllowedValues:
      - "yes"
      - "no"
    Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
    Type: String
  RegisterNlbTargetsLambdaArn:
    Description: ARN for NLB IP target registration lambda.
    Type: String
  ExternalApiTargetGroupArn:
    Description: ARN for external API load balancer target group.
    Type: String

```

InternalApiTargetGroupArn:  
 Description: ARN for internal API load balancer target group.  
 Type: String

InternalServiceTargetGroupArn:  
 Description: ARN for internal service load balancer target group.  
 Type: String

BootstrapInstanceType:  
 Description: Instance type for the bootstrap EC2 instance  
 Default: "i3.large"  
 Type: String

#### Metadata:

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

## 5.13.16. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

### IMPORTANT

The CloudFormation template creates a stack that represents three control plane nodes.

### NOTE

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
```

```

    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcoshAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZoneId", 7
    "ParameterValue": "<random_string>" 8
  },
  {
    "ParameterKey": "PrivateHostedZoneName", 9
    "ParameterValue": "mycluster.example.com" 10
  },
  {
    "ParameterKey": "Master0Subnet", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "Master1Subnet", 13
    "ParameterValue": "subnet-<random_string>" 14
  },
  {
    "ParameterKey": "Master2Subnet", 15
    "ParameterValue": "subnet-<random_string>" 16
  },
  {
    "ParameterKey": "MasterSecurityGroupID", 17
    "ParameterValue": "sg-<random_string>" 18
  },
  {
    "ParameterKey": "IgnitionLocation", 19
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
  } 20
  {
    "ParameterKey": "CertificateAuthorities", 21
    "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
  },
  {
    "ParameterKey": "MasterInstanceProfileName", 23
    "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
  },
  {
    "ParameterKey": "MasterInstanceType", 25
    "ParameterValue": "m6i.xlarge" 26
  },
  {
    "ParameterKey": "AutoRegisterELB", 27

```

```

    "ParameterValue": "yes" 28
  },
  {
    "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 31
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 33
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 35
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.
- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster\_name>.<domain\_name>** where **<domain\_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.

- 17 The master security group ID to associate with control plane nodes.
  - 18 Specify the **MasterSecurityGroupid** value from the output of the CloudFormation template for the security group and roles.
  - 19 The location to fetch control plane Ignition config file from.
  - 20 Specify the generated Ignition config file location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/master](https://api-int.<cluster_name>.<domain_name>:22623/config/master).
  - 21 The base64 encoded certificate authority string to use.
  - 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
  - 23 The IAM profile to associate with control plane nodes.
  - 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
  - 25 The type of AWS instance to use for the control plane machines.
  - 26 The instance type value corresponds to the minimum resource requirements for control plane machines.
  - 27 Whether or not to register a network load balancer (NLB).
  - 28 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
  - 29 The ARN for NLB IP target registration lambda group.
  - 30 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 31 The ARN for external API load balancer target group.
  - 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 33 The ARN for internal API load balancer target group.
  - 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 35 The ARN for internal service load balancer target group.
  - 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.

- If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
- Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

### NOTE

The CloudFormation template creates a stack that represents three control plane nodes.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

#### 5.13.16.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

##### Example 5.48. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
```

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: AWS::EC2::Image::Id

AutoRegisterDNS:

Default: "yes"

AllowedValues:

- "yes"

- "no"

Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone information?

Type: String

PrivateHostedZoneId:

Description: The Route53 private zone ID to register the etcd targets with, such as Z21IXYZABCZ2A4.

Type: String

PrivateHostedZoneName:

Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit the trailing period.

Type: String

Master0Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

Master1Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

Master2Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

MasterSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:

Default: [https://api-int.\\$CLUSTER\\_NAME.\\$DOMAIN:22623/config/master](https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master)

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: data:text/plain;charset=utf-8;base64,ABC...xYz==

Description: Base64 encoded certificate authority string to use.

Type: String

MasterInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

MasterInstanceType:

Default: m5.xlarge

Type: String

AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"

- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- MasterInstanceType

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

### 5.13.17. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

#### IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

## NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

## Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcocAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "WorkerSecurityGroupld", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
  },
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  }
]
```

```

    },
    {
      "ParameterKey": "WorkerInstanceProfileName", 13
      "ParameterValue": "" 14
    },
    {
      "ParameterKey": "WorkerInstanceType", 15
      "ParameterValue": "m6i.large" 16
    }
  ]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
  - 4 Specify an **AWS::EC2::Image::Id** value.
  - 5 A subnet, preferably private, to start the worker nodes on.
  - 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
  - 7 The worker security group ID to associate with worker nodes.
  - 8 Specify the **WorkerSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
  - 9 The location to fetch the bootstrap Ignition config file from.
  - 10 Specify the generated Ignition config location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/worker](https://api-int.<cluster_name>.<domain_name>:22623/config/worker).
  - 11 Base64 encoded certificate authority string to use.
  - 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
  - 13 The IAM profile to associate with worker nodes.
  - 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
  - 15 The type of AWS instance to use for the compute machines.
  - 16 The instance type value corresponds to the minimum resource requirements for compute machines.
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

- Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
- Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
- Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml \ 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

**NOTE**

The CloudFormation template creates a stack that represents one worker node.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

- Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

**5.13.17.1. CloudFormation template for worker machines**

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

#### Example 5.49. CloudFormation template for worker machines

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  WorkerSecurityGroupId:
    Description: The master security group ID to associate with master nodes.
    Type: AWS::EC2::SecurityGroup::Id
  IgnitionLocation:
    Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
    Description: Ignition config file location.
    Type: String
  CertificateAuthorities:
    Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
    Description: Base64 encoded certificate authority string to use.
    Type: String
  WorkerInstanceProfileName:
    Description: IAM profile to associate with master nodes.
    Type: String
  WorkerInstanceType:
    Default: m5.large
    Type: String

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Cluster Information"
        Parameters:
          - InfrastructureName
      - Label:
          default: "Host Information"
        Parameters:
          - WorkerInstanceType
          - RhcosAmi
          - IgnitionLocation
          - CertificateAuthorities
          - WorkerSecurityGroupId
  
```

```

- WorkerInstanceProfileName
- Label:
  default: "Network Configuration"
Parameters:
- Subnet
ParameterLabels:
Subnet:
  default: "Subnet"
InfrastructureName:
  default: "Infrastructure Name"
WorkerInstanceType:
  default: "Worker Instance Type"
WorkerInstanceProfileName:
  default: "Worker Instance Profile Name"
RhcosAmi:
  default: "Red Hat Enterprise Linux CoreOS AMI ID"
IgnitionLocation:
  default: "Worker Ignition Source"
CertificateAuthorities:
  default: "Ignition CA String"
WorkerSecurityGroupId:
  default: "Worker Security Group ID"

Resources:
Worker0:
  Type: AWS::EC2::Instance
  Properties:
    ImageId: !Ref RhcosAmi
    BlockDeviceMappings:
      - DeviceName: /dev/xvda
        Ebs:
          VolumeSize: "120"
          VolumeType: "gp2"
    IamInstanceProfile: !Ref WorkerInstanceProfileName
    InstanceType: !Ref WorkerInstanceType
    NetworkInterfaces:
      - AssociatePublicIpAddress: "false"
        DeviceIndex: "0"
        GroupSet:
          - !Ref "WorkerSecurityGroupId"
        SubnetId: !Ref "Subnet"
    UserData:
      Fn::Base64: !Sub
        - {"ignition":{"config":{"merge":[{"source":"${SOURCE}"]},"security":{"tls":
{"certificateAuthorities":[{"source":"${CA_BUNDLE}"]},"version":"3.1.0"}}}
        - {
          SOURCE: !Ref IgnitionLocation,
          CA_BUNDLE: !Ref CertificateAuthorities,
        }
    Tags:
      - Key: !Join [ "", ["kubernetes.io/cluster/", !Ref InfrastructureName] ]
        Value: "shared"

Outputs:

```

PrivateIP:

Description: The compute node private IP address.

Value: !GetAtt Worker0.PrivateIp

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

## 5.13.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

### Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
```

```
INFO API v1.23.0 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

#### NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

#### Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.
- You can view details about the running instances that are created by using the [AWS EC2 console](#).

### 5.13.19. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

■

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

## 5.13.20. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

## 5.13.21. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

### Prerequisites

- You added machines to your cluster.

### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.23.0
master-1  Ready   master 63m  v1.23.0
master-2  Ready   master 64m  v1.23.0
```

The output lists all of the machines that you created.

**NOTE**

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

```
NAME      AGE      REQUESTOR                                     CONDITION
csr-8b2br 15m     system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m     system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n' | xargs --no-run-if-empty oc adm certificate approve
```

#### NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

#### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS   ROLES    AGE   VERSION
master-0  Ready   master   73m   v1.23.0
master-1  Ready   master   73m   v1.23.0
```

```

master-2 Ready   master 74m v1.23.0
worker-0 Ready   worker 11m v1.23.0
worker-1 Ready   worker 11m v1.23.0

```

## NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 5.13.22. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

#### Prerequisites

- Your control plane has initialized.

#### Procedure

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

#### Example output

NAME	VERSION	AVAILABLE	PROGRESSING	DEGRADED	SINCE
authentication	4.10.0	True	False	False	19m
baremetal	4.10.0	True	False	False	37m
cloud-credential	4.10.0	True	False	False	40m
cluster-autoscaler	4.10.0	True	False	False	37m
config-operator	4.10.0	True	False	False	38m
console	4.10.0	True	False	False	26m
csi-snapshot-controller	4.10.0	True	False	False	37m

operator-lifecycle-manager-packageserver	4.10.0	True	False	False	32m
service-ca	4.10.0	True	False	False	38m
storage	4.10.0	True	False	False	37m

2. Configure the Operators that are not available.

### 5.13.22.1. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

You can configure registry storage for user-provisioned infrastructure in AWS to deploy OpenShift Container Platform to hidden regions. See [Configuring the registry for AWS user-provisioned infrastructure](#) for more information.

#### 5.13.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

#### Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY\_STORAGE\_S3\_ACCESSKEY**
  - **REGISTRY\_STORAGE\_S3\_SECRETKEY**

#### Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

### Example configuration

```
storage:
  s3:
    bucket: <bucket-name>
    region: <region-name>
```

#### WARNING

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

#### 5.13.22.1.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

#### Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}'
```

#### WARNING

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

#### 5.13.23. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

#### Prerequisites

- You completed the initial Operator configuration for your cluster.

## Procedure

1. Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):

- Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

- 1** **<name>** is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

## 5.13.24. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

### Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

### Procedure

1. Determine the routes to create.
  - To create a wildcard record, use **\*.apps.<cluster\_name>.<domain\_name>**, where **<cluster\_name>** is your cluster name, and **<domain\_name>** is the Route 53 base domain for your OpenShift Container Platform cluster.
  - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}\n'} routes
```

#### Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>  
console-openshift-console.apps.<cluster_name>.<domain_name>  
downloads-openshift-console.apps.<cluster_name>.<domain_name>  
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>  
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>  
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

- Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

### Example output

```
NAME          TYPE          CLUSTER-IP    EXTERNAL-IP          PORT(S)
AGE
router-default LoadBalancer 172.30.62.215  ab3...28.us-east-2.elb.amazonaws.com
80:31499/TCP,443:30693/TCP 5m
```

- Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>").CanonicalHostedZoneNameID' 1
```

- For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

### Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

- Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
  --dns-name "<domain_name>" 1
  --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
  `<domain_name>.`].Id' 2
  --output text
```

- For **<domain\_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

### Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

- Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
```

```

>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", 2
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", 3
>       "DNSName": "<external_ip>.", 4
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'

```

- 1 For **<private\_hosted\_zone\_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```

$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{ 1
>   "Changes": [
>     {
>       "Action": "CREATE",
>       "ResourceRecordSet": {
>         "Name": "\\052.apps.<cluster_domain>", 2
>         "Type": "A",
>         "AliasTarget":{
>           "HostedZoneId": "<hosted_zone_id>", 3
>           "DNSName": "<external_ip>.", 4
>           "EvaluateTargetHealth": false
>         }
>       }
>     }
>   ]
> }'

```

- 1 For **<public\_hosted\_zone\_id>**, specify the public hosted zone for your domain.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.

- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

### 5.13.25. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

#### Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

#### Procedure

- From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

#### Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 1s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 5.13.26. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

- 
- 3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.13.27. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 5.13.28. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

### 5.13.29. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 5.14. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.10, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

#### IMPORTANT

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

## IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 5.14.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [created a mirror registry on your mirror host](#) and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

## IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You [configured an AWS account](#) to host the cluster.

## IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

## NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.14.2. About installations in restricted networks

In OpenShift Container Platform 4.10, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift image registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

### IMPORTANT

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

#### 5.14.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

#### 5.14.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.14.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 5.14.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 5.50. Minimum required hosts**

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

#### IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.4, or RHEL 8.5.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

#### 5.14.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.51. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 <sup>[3]</sup>	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 5.14.4.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.50. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***

- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

#### 5.14.4.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) ARM64 instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 5.51. Machine types based on 64-bit ARM architecture

- **c6g.\***
- **m6g.\***

#### 5.14.4.5. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

#### 5.14.5. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

#### 5.14.5.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

#### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.

Component	AWS type	Description												
Public subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCElasticGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NATGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkACL</b></li> <li>● <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													

Component	AWS type	Description
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

## Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api.<cluster\_name>.<domain>** must point to the external load balancer, and an entry for **api-int.<cluster\_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	<b>AWS::Route53::HostedZone</b>	The hosted zone for your internal DNS.
etcd record sets	<b>AWS::Route53::RecordSet</b>	The registration records for etcd for your control plane machines.
Public load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your public subnets.
External API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the external API server.
External listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the external load balancer.

Component	AWS type	Description
External target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the external load balancer.
Private load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your private subnets.
Internal API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the internal API server.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 22623 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.

## Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
<b>MasterSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>6443</b>
		<b>tcp</b>	<b>22623</b>

Group	Type	IP Protocol	Port range
WorkerSecurityGroup	AWS::EC2::SecurityGroup	icmp	0
		tcp	22
BootstrapSecurityGroup	AWS::EC2::SecurityGroup	tcp	22
		tcp	19531

## Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>MasterIngressEtcd</b>	etcd	tcp	2379- 2380
<b>MasterIngressVxlan</b>	Vxlan packets	udp	4789
<b>MasterIngressWorkerVxlan</b>	Vxlan packets	udp	4789
<b>MasterIngressInternal</b>	Internal cluster communication and Kubernetes proxy metrics	tcp	9000 - 9999
<b>MasterIngressWorkerInternal</b>	Internal cluster communication	tcp	9000 - 9999
<b>MasterIngressKube</b>	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
<b>MasterIngressWorkerKube</b>	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
<b>MasterIngressIngressServices</b>	Kubernetes Ingress services	tcp	30000 - 32767
<b>MasterIngressWorkerIngressServices</b>	Kubernetes Ingress services	tcp	30000 - 32767
<b>MasterIngressGeneve</b>	Geneve packets	udp	6081

Ingress group	Description	IP protocol	Port range
<b>MasterIngress WorkerGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>MasterIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress WorkerIpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>MasterIngress WorkerIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>MasterIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress WorkerIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress WorkerInternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress IngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>MasterIngress WorkerIngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress Vxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress WorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress Internal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress WorkerInternal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress Kube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress WorkerKube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress IngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress WorkerIngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress Geneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress MasterGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress MasterIpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>WorkerIngress MasterIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress MasterIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress MasterInternal UDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress IngressServices UDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>WorkerIngress MasterIngress ServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	<b>Allow</b>	<b>ec2:*</b>	<b>*</b>
	<b>Allow</b>	<b>elasticloadbalancing :*</b>	<b>*</b>
	<b>Allow</b>	<b>iam:PassRole</b>	<b>*</b>
	<b>Allow</b>	<b>s3:GetObject</b>	<b>*</b>
Worker	<b>Allow</b>	<b>ec2:Describe*</b>	<b>*</b>
Bootstrap	<b>Allow</b>	<b>ec2:Describe*</b>	<b>*</b>

Role	Effect	Action	Resource
	<b>Allow</b>	<b>ec2:AttachVolume</b>	*
	<b>Allow</b>	<b>ec2:DetachVolume</b>	*

### 5.14.5.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

### 5.14.5.3. Required AWS permissions for the IAM user

#### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

#### Example 5.52. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**

- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**

- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 5.53. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

#### NOTE

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 5.54. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**

- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 5.55. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

**Example 5.56. Required IAM permissions for installation**

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

**Example 5.57. Required Route 53 permissions for installation**

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**

- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 5.58. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 5.59. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 5.60. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3:DeleteObject**
- **s3:ListBucketVersions**
- **tag:GetResources**

Example 5.61. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**

- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

#### Example 5.62. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

#### Example 5.63. Additional IAM and S3 permissions that are required to create manifests

- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam:ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3:ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 5.64. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

**5.14.6. Generating a key pair for cluster node SSH access**

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1** Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

### 5.14.7. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

#### 5.14.7.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

#### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

#### Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

## Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

- Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

## Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

- Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.10.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
    partitions:
      - label: var
        start_mib: <partition_start_offset> 2
        size_mib: <partition_size> 3
    filesystems:
      - device: /dev/disk/by-partlabel/var
        path: /var
        format: xfs
        mount_options: [defaults, prjquota] 4
        with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.

- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

#### NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

#### 5.14.7.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

##### Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

##### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

## IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

## NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

## NOTE

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to give the additional information that is required for an installation in a restricted network.
    - a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<local_registry>": {"auth": "<credentials>","email": "you@example.com"}}}'
```

For **<local\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value. The value must be the contents of the certificate file that you used for your mirror registry. The certificate file can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----

  /-----END CERTIFICATE-----
```

- c. Add the image content resources:

```
imageContentSources:
- mirrors:
  - <local_registry>/<local_repository_name>/release
  source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - <local_registry>/<local_repository_name>/release
  source: quay.io/openshift-release-dev/ocp-v4.0-art-dev
```

Use the **imageContentSources** section from the output of the command to mirror the repository or the values that you used when you mirrored the content from the media that you brought into your restricted network.

- d. Optional: Set the publishing strategy to **Internal**:

```
publish: Internal
```

By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Optional: Back up the **install-config.yaml** file.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

### 5.14.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of

them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 5.14.7.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### Prerequisites

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.
- You created the **install-config.yaml** installation configuration file.

## Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yaml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the **<installation\_directory>/manifests/cluster-scheduler-02-config.yaml** file.
- b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
- c. Save and exit the file.

5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the **<installation\_directory>/manifests/cluster-dns-02-config.yaml** DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- 1** **2** Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

- To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- For **<installation\_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation\_directory>/auth** directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

### 5.14.8. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

#### Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

#### Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

#### Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

### 5.14.9. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

#### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "VpcCidr", 1
    "ParameterValue": "10.0.0.0/16" 2
  },
  {
    "ParameterKey": "AvailabilityZoneCount", 3
    "ParameterValue": "1" 4
  },
  {
    "ParameterKey": "SubnetBits", 5
    "ParameterValue": "12" 6
  }
]
```

- 1 The CIDR block for the VPC.
- 2 Specify a CIDR block in the format **x.x.x.x/16-24**.
- 3 The number of availability zones to deploy the VPC in.
- 4 Specify an integer between **1** and **3**.

- 5 The size of each subnet in each availability zone.
  - 6 Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.
2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>VpcId</b>	The ID of your VPC.
<b>PublicSubnetIds</b>	The IDs of the new public subnets.
<b>PrivateSubnetIds</b>	The IDs of the new private subnets.

### 5.14.9.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

#### Example 5.65. CloudFormation template for the VPC

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5]).){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\.(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number
  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Network Configuration"
        Parameters:
          - VpcCidr
          - SubnetBits
      - Label:
          default: "Availability Zones"
        Parameters:
          - AvailabilityZoneCount
    ParameterLabels:
      AvailabilityZoneCount:
        default: "Availability Zone Count"
      VpcCidr:
        default: "VPC CIDR"
      SubnetBits:
        default: "Bits Per Subnet"

```

### 5.14.10. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

#### Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1** For the **<route53\_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

### Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

- Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  },
  {
    "ParameterKey": "InfrastructureName", 3
    "ParameterValue": "mycluster-<random_string>" 4
  },
  {
    "ParameterKey": "HostedZoneId", 5
    "ParameterValue": "<random_string>" 6
  },
  {
    "ParameterKey": "HostedZoneName", 7
    "ParameterValue": "example.com" 8
  },
  {
    "ParameterKey": "PublicSubnets", 9
    "ParameterValue": "subnet-<random_string>" 10
  },
  {
    "ParameterKey": "PrivateSubnets", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "VpcId", 13
    "ParameterValue": "vpc-<random_string>" 14
  }
]
```

- 1** A short, representative cluster name to use for hostnames, etc.
- 2** Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
- 3** The name for your cluster infrastructure that is encoded in your Ignition config files for the

- 4 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 5 The Route 53 public zone ID to register the targets with.
  - 6 Specify the Route 53 public zone ID, which as a format similar to **Z21IXYZABCZ2A4**. You can obtain this value from the AWS console.
  - 7 The Route 53 zone to register the targets with.
  - 8 Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
  - 9 The public subnets that you created for your VPC.
  - 10 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 11 The private subnets that you created for your VPC.
  - 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 13 The VPC that you created for the cluster.
  - 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

#### IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

#### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.

- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>PrivateHostedZoneId</b>	Hosted zone ID for the private DNS.
<b>ExternalApiLoadBalancerName</b>	Full name of the external API load balancer.
<b>InternalApiLoadBalancerName</b>	Full name of the internal API load balancer.
<b>ApiServerDnsName</b>	Full hostname of the API server.
<b>RegisterNlbTargetGroupsLambda</b>	Lambda ARN useful to help register/deregister IP targets for these load balancers.
<b>ExternalApiTargetGroupArn</b>	ARN of external API target group.
<b>InternalApiTargetGroupArn</b>	ARN of internal API target group.

<b>InternalServiceTargetGroupArn</b>	ARN of internal service target group.
--------------------------------------	---------------------------------------

### 5.14.10.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

#### Example 5.66. CloudFormation template for the network and load balancers

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
  ClusterName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, representative cluster name to use for host names and other identifying
    names.
    Type: String
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  HostedZoneId:
    Description: The Route53 public zone ID to register the targets with, such as
    Z21IXYZABCZ2A4.
    Type: String
  HostedZoneName:
    Description: The Route53 zone to register the targets with, such as example.com. Omit the
    trailing period.
    Type: String
    Default: "example.com"
  PublicSubnets:
    Description: The internet-facing subnets.
    Type: List<AWS::EC2::Subnet::Id>
  PrivateSubnets:
    Description: The internal subnets.
    Type: List<AWS::EC2::Subnet::Id>
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id

Metadata:
```

```
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label:
    default: "Cluster Information"
    Parameters:
    - ClusterName
    - InfrastructureName
  - Label:
    default: "Network Configuration"
    Parameters:
    - VpcId
    - PublicSubnets
    - PrivateSubnets
  - Label:
    default: "DNS"
    Parameters:
    - HostedZoneName
    - HostedZoneId
  ParameterLabels:
  ClusterName:
    default: "Cluster Name"
  InfrastructureName:
    default: "Infrastructure Name"
  VpcId:
    default: "VPC ID"
  PublicSubnets:
    default: "Public Subnets"
  PrivateSubnets:
    default: "Private Subnets"
  HostedZoneName:
    default: "Public Hosted Zone Name"
  HostedZoneId:
    default: "Public Hosted Zone ID"

Resources:
  ExtApiElb:
    Type: AWS::ElasticLoadBalancingV2::LoadBalancer
    Properties:
      Name: !Join ["-", [!Ref InfrastructureName, "ext"]]
      IpAddressType: ipv4
      Subnets: !Ref PublicSubnets
      Type: network

  IntApiElb:
    Type: AWS::ElasticLoadBalancingV2::LoadBalancer
    Properties:

  "ec2:CreateTags"
]
```

```
Resource: "arn:aws:ec2:*:*:subnet/*"
```

```
- Effect: "Allow"
```

## Action:

```
[
  "ec2:DescribeSubnets",
  "ec2:DescribeTags"
]
```

```
Resource: ""
```

## RegisterSubnetTags:

```
Type: "AWS::Lambda::Function"
```

## Properties:

```
Handler: "index.handler"
```

## Role:

```
Fn::GetAtt:
```

```
- "RegisterSubnetTagsLambdalamRole"
```

```
- "Arn"
```

## Code:

```
ZipFile: |
```

```
import json
```

```
import boto3
```

```
import cfnresponse
```

```
def handler(event, context):
```

```
    ec2_client = boto3.client('ec2')
```

```
    if event['RequestType'] == 'Delete':
```

```
        for subnet_id in event['ResourceProperties']['Subnets']:
```

```
            ec2_client.delete_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
```

```
event['ResourceProperties']['InfrastructureName']});
```

```
    elif event['RequestType'] == 'Create':
```

```
        for subnet_id in event['ResourceProperties']['Subnets']:
```

```
            ec2_client.create_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
```

```
event['ResourceProperties']['InfrastructureName'], 'Value': 'shared'}]);
```

```
        responseData = {}
```

```
        cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData,
```

```
event['ResourceProperties']['InfrastructureName']+event['ResourceProperties']['Subnets'][0])
```

```
Runtime: "python3.7"
```

```
Timeout: 120
```

## RegisterPublicSubnetTags:

```
Type: Custom::SubnetRegister
```

## Properties:

```
ServiceToken: !GetAtt RegisterSubnetTags.Arn
```

```
InfrastructureName: !Ref InfrastructureName
```

```
Subnets: !Ref PublicSubnets
```

RegisterPrivateSubnetTags:  
 Type: Custom::SubnetRegister  
 Properties:  
 ServiceToken: !GetAtt RegisterSubnetTags.Arn  
 InfrastructureName: !Ref InfrastructureName  
 Subnets: !Ref PrivateSubnets

#### Outputs:

PrivateHostedZoneId:  
 Description: Hosted zone ID for the private DNS, which is required for private records.  
 Value: !Ref IntDns

ExternalApiLoadBalancerName:  
 Description: Full name of the external API load balancer.  
 Value: !GetAtt ExtApiElb.LoadBalancerFullName

InternalApiLoadBalancerName:  
 Description: Full name of the internal API load balancer.  
 Value: !GetAtt IntApiElb.LoadBalancerFullName

ApiServerDnsName:  
 Description: Full hostname of the API server, which is required for the Ignition config files.  
 Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]

RegisterNlbTargetsLambda:  
 Description: Lambda ARN useful to help register or deregister IP targets for these load balancers.  
 Value: !GetAtt RegisterNlbTargets.Arn

ExternalApiTargetGroupArn:  
 Description: ARN of the external API target group.  
 Value: !Ref ExternalApiTargetGroup

InternalApiTargetGroupArn:  
 Description: ARN of the internal API target group.  
 Value: !Ref InternalApiTargetGroup

InternalServiceTargetGroupArn:  
 Description: ARN of the internal service target group.  
 Value: !Ref InternalServiceTargetGroup

## IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

### Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

## 5.14.11. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "VpcCidr", 3
    "ParameterValue": "10.0.0.0/16" 4
  },
  {
    "ParameterKey": "PrivateSubnets", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "VpcId", 7
    "ParameterValue": "vpc-<random_string>" 8
  }
]
```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 The CIDR block for the VPC.

- 4 Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
  - 5 The private subnets that you created for your VPC.
  - 6 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 7 The VPC that you created for the cluster.
  - 8 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
2. Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>MasterSecurityGroupID</b>	Master Security Group ID
<b>WorkerSecurityGroupID</b>	Worker Security Group ID
<b>MasterInstanceProfile</b>	Master IAM Instance Profile
<b>WorkerInstanceProfile</b>	Worker IAM Instance Profile

#### 5.14.11.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

##### Example 5.67. CloudFormation template for security objects

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^((([0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|2[0-4][0-9]{1,3}|25[0-5]).).){3}([0-9]{1,3}|2[0-
    4][0-9]{1,3}|25[0-5])(\V(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  VpcId:

### 5.14.12. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

#### Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
  - Print the current **x86\_64** or **aarch64** AMI for an AWS region, such as **us-west-1**:

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

#### Example output

```
ami-0d3e625f84626bbda
```

The output of this command is the AWS AMI ID for your designated architecture and the **us-west-1** region. The AMI must belong to the same region as the cluster.

### 5.14.13. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.

**NOTE**

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 5.52. x86\_64 RHCOS AMIs

#### 5.14.14. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

#### NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

#### Procedure

1. Provide a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster's region and upload the Ignition config file to it.

#### IMPORTANT

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

## IMPORTANT

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the **s3://** schema.

## NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

- a. Create the bucket:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1** **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

- b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-  
infra/bootstrap.ign 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

### Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[  
  {  
    "ParameterKey": "InfrastructureName", 1  
    "ParameterValue": "mycluster-<random_string>" 2  
  },  
  {  
    "ParameterKey": "RhcOsAmi", 3  
    "ParameterValue": "ami-<random_string>" 4  
  },  
  {  
    "ParameterKey": "AllowedBootstrapSshCidr", 5
```

```

    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroup", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcId", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  },
  {
    "ParameterKey": "RegisterNlbTargetsLambdaArn", 17
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 18
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 19
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 21
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 23
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.
- 4 Specify a valid **AWS::EC2::Image::Id** value.

- 5 CIDR block to allow SSH access to the bootstrap node.
  - 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
  - 7 The public subnet that is associated with your VPC to launch the bootstrap node into.
  - 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 9 The master security group ID (for registering temporary rules)
  - 10 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
  - 11 The VPC created resources will belong to.
  - 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
  - 13 Location to fetch bootstrap Ignition config file from.
  - 14 Specify the S3 bucket and file name in the form **s3://<bucket\_name>/bootstrap.ign**.
  - 15 Whether or not to register a network load balancer (NLB).
  - 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
  - 17 The ARN for NLB IP target registration lambda group.
  - 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 19 The ARN for external API load balancer target group.
  - 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 21 The ARN for internal API load balancer target group.
  - 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 23 The ARN for internal service load balancer target group.
  - 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
3. Copy the template from the **CloudFormation template for the bootstrap machines** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
  4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

## IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4** You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>Bootstrap Instanceld</b>	The bootstrap Instance ID.
<b>Bootstrap PublicIp</b>	The bootstrap node public IP address.
<b>Bootstrap PrivateIp</b>	The bootstrap node private IP address.

#### 5.14.14.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

#### Example 5.68. CloudFormation template for the bootstrap machine

■

AWSTemplateFormatVersion: [2010-09-09](#)

Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:

InfrastructureName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: [27](#)

MinLength: [1](#)

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of [27](#) characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: `AWS::EC2::Image::Id`

AllowedBootstrapSshCidr:

AllowedPattern: `^(((0-9){1-9}|0)|10|127|169|192|240|254|255)\.((0-9){1-3}|0)|255\.(0-9){1-3}|25[0-5]|4[0-9]|2[0-4]|25[0-5])\.((0-9){1-3}|0)|255\.(0-9){1-3}|25[0-5]|4[0-9]|2[0-4]|25[0-5])\.(0-9){1-3}|0)|255\.(0-9){1-3}|25[0-5]|4[0-9]|2[0-4]|25[0-5])$`

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.

Default: [0.0.0.0/0](#)

Description: CIDR block to allow SSH access to the bootstrap node.

Type: String

PublicSubnet:

Description: The public subnet to launch the bootstrap node into.

Type: `AWS::EC2::Subnet::Id`

MasterSecurityGroupId:

Description: The master security group ID for registering temporary rules.

Type: `AWS::EC2::SecurityGroup::Id`

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: `AWS::EC2::VPC::Id`

BootstrapIgnitionLocation:

Default: `s3://my-s3-bucket/bootstrap.ign`

Description: Ignition config file location.

Type: String

AutoRegisterELB:

Default: `"yes"`

AllowedValues:

- `"yes"`

- `"no"`

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group.

Type: String

BootstrapInstanceType:

Description: Instance type for the bootstrap EC2 instance

Default: "i3.large"

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- RhcosAmi

- BootstrapIgnitionLocation

- MasterSecurityGroupId

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- AllowedBootstrapSshCidr

- PublicSubnet

- Label:

default: "Load Balancer Automation"

Parameters:

- AutoRegisterELB

- RegisterNLbpTargetsLambdaArn

- ExternalApiTargetGroupArn

- InternalApiTargetGroupArn

- InternalServiceTargetGroupArn

ParameterLabels:

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

AllowedBootstrapSshCidr:

default: "Allowed SSH Source"

PublicSubnet:

default: "Public Subnet"

RhcosAmi:

default: "Red Hat Enterprise Linux CoreOS AMI ID"

BootstrapIgnitionLocation:

default: "Bootstrap Ignition Source"

MasterSecurityGroupId:

default: "Master Security Group ID"

```

## Additional resources

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

### 5.14.15. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

#### IMPORTANT

The CloudFormation template creates a stack that represents three control plane nodes.

#### NOTE

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

#### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcocAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
]
```

```

{
  "ParameterKey": "PrivateHostedZoneId", 7
  "ParameterValue": "<random_string>" 8
},
{
  "ParameterKey": "PrivateHostedZoneName", 9
  "ParameterValue": "mycluster.example.com" 10
},
{
  "ParameterKey": "Master0Subnet", 11
  "ParameterValue": "subnet-<random_string>" 12
},
{
  "ParameterKey": "Master1Subnet", 13
  "ParameterValue": "subnet-<random_string>" 14
},
{
  "ParameterKey": "Master2Subnet", 15
  "ParameterValue": "subnet-<random_string>" 16
},
{
  "ParameterKey": "MasterSecurityGroupID", 17
  "ParameterValue": "sg-<random_string>" 18
},
{
  "ParameterKey": "IgnitionLocation", 19
  "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
20
},
{
  "ParameterKey": "CertificateAuthorities", 21
  "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
},
{
  "ParameterKey": "MasterInstanceProfileName", 23
  "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
},
{
  "ParameterKey": "MasterInstanceType", 25
  "ParameterValue": "m6i.xlarge" 26
},
{
  "ParameterKey": "AutoRegisterELB", 27
  "ParameterValue": "yes" 28
},
{
  "ParameterKey": "RegisterNLBTargetsLambdaArn", 29
  "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNLBTargets-<random_string>" 30
},
{
  "ParameterKey": "ExternalApiTargetGroupArn", 31
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:

```

```

<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 33
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 35
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.
- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster\_name>.<domain\_name>** where **<domain\_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17 The master security group ID to associate with control plane nodes.
- 18 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 19 The location to fetch control plane Ignition config file from.
- 20 Specify the generated Ignition config file location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/master](https://api-int.<cluster_name>.<domain_name>:22623/config/master).
- 21 The base64 encoded certificate authority string to use.

- 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
  - 23 The IAM profile to associate with control plane nodes.
  - 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
  - 25 The type of AWS instance to use for the control plane machines.
  - 26 The instance type value corresponds to the minimum resource requirements for control plane machines.
  - 27 Whether or not to register a network load balancer (NLB).
  - 28 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
  - 29 The ARN for NLB IP target registration lambda group.
  - 30 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 31 The ARN for external API load balancer target group.
  - 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 33 The ARN for internal API load balancer target group.
  - 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 35 The ARN for internal service load balancer target group.
  - 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
  3. If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
  4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

### IMPORTANT

You must enter the command on a single line.

-

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

#### NOTE

The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

### 5.14.15.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

#### Example 5.69. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AutoRegisterDNS:
    Default: "yes"
    AllowedValues:
```

- "yes"

- "no"

Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone information?

Type: String

PrivateHostedZoneId:

Description: The Route53 private zone ID to register the etcd targets with, such as Z21IXYZABCZ2A4.

Type: String

PrivateHostedZoneName:

Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit the trailing period.

Type: String

Master0Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

Master1Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

Master2Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

MasterSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:

Default: [https://api-int.\\$CLUSTER\\_NAME.\\$DOMAIN:22623/config/master](https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master)

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: data:text/plain;charset=utf-8;base64,ABC...xYz==

Description: Base64 encoded certificate authority string to use.

Type: String

MasterInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

MasterInstanceType:

Default: m5.xlarge

Type: String

AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"

- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNLBIPTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

Metadata:

### 5.14.16. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

#### IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

#### NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

## Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcOsAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "WorkerSecurityGroupId", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
    10
  },
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  },
  {
    "ParameterKey": "WorkerInstanceProfileName", 13
    "ParameterValue": "" 14
  },
  {
    "ParameterKey": "WorkerInstanceType", 15
    "ParameterValue": "m6i.large" 16
  }
]
```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.

- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
  - 4 Specify an **AWS::EC2::Image::Id** value.
  - 5 A subnet, preferably private, to start the worker nodes on.
  - 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
  - 7 The worker security group ID to associate with worker nodes.
  - 8 Specify the **WorkerSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.
  - 9 The location to fetch the bootstrap Ignition config file from.
  - 10 Specify the generated Ignition config location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/worker](https://api-int.<cluster_name>.<domain_name>:22623/config/worker).
  - 11 Base64 encoded certificate authority string to use.
  - 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
  - 13 The IAM profile to associate with worker nodes.
  - 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
  - 15 The type of AWS instance to use for the compute machines.
  - 16 The instance type value corresponds to the minimum resource requirements for compute machines.
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.
  3. Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
  4. Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
  5. Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml \ 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

#### NOTE

The CloudFormation template creates a stack that represents one worker node.

6. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

7. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

#### IMPORTANT

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

### 5.14.16.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

#### Example 5.70. CloudFormation template for worker machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
```

Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: AWS::EC2::Image::Id

Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

WorkerSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:

Default: [https://api-int.\\$CLUSTER\\_NAME.\\$DOMAIN:22623/config/worker](https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker)

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: `data:text/plain;charset=utf-8;base64,ABC...xYz==`

Description: Base64 encoded certificate authority string to use.

Type: String

WorkerInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

WorkerInstanceType:

Default: m5.large

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- WorkerInstanceType

- RhcosAmi

- IgnitionLocation

- CertificateAuthorities

- WorkerSecurityGroupId

- WorkerInstanceProfileName

- Label:

default: "Network Configuration"

Parameters:

- Subnet

ParameterLabels:

Subnet:

default: "Subnet"

InfrastructureName:

default: "Infrastructure Name"

WorkerInstanceType:

default: "Worker Instance Type"

WorkerInstanceProfileName:

default: "Worker Instance Profile Name"

RhcosAmi:

```

    default: "Red Hat Enterprise Linux CoreOS AMI ID"
  IgnitionLocation:
    default: "Worker Ignition Source"
  CertificateAuthorities:
    default: "Ignition CA String"
  WorkerSecurityGroupId:
    default: "Worker Security Group ID"

Resources:
  Worker0:
    Type: AWS::EC2::Instance
    Properties:
      ImageId: !Ref RhcosAmi
      BlockDeviceMappings:
        - DeviceName: /dev/xvda
          Ebs:
            VolumeSize: "120"
            VolumeType: "gp2"
      IamInstanceProfile: !Ref WorkerInstanceProfileName
      InstanceType: !Ref WorkerInstanceType
      NetworkInterfaces:
        - AssociatePublicIp: "false"
          DeviceIndex: "0"
          GroupSet:
            - !Ref "WorkerSecurityGroupId"
          SubnetId: !Ref "Subnet"
      UserData:
        Fn::Base64: !Sub
          - '{"ignition":{"config":{"merge":[{"source":"${SOURCE}"}]},"security":{"tls":
{"certificateAuthorities":[{"source":"${CA_BUNDLE}"}]},"version":"3.1.0"}}'
          - {
              SOURCE: !Ref IgnitionLocation,
              CA_BUNDLE: !Ref CertificateAuthorities,
            }
      Tags:
        - Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
          Value: "shared"

Outputs:
  PrivateIP:
    Description: The compute node private IP address.
    Value: !GetAtt Worker0.PrivateIp

```

### 5.14.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.

- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

## Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
INFO API v1.23.0 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

### NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

## Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.

## 5.14.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

## 5.14.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

### Prerequisites

- You added machines to your cluster.

### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS    ROLES    AGE   VERSION
master-0  Ready    master   63m   v1.23.0
master-1  Ready    master   63m   v1.23.0
master-2  Ready    master   64m   v1.23.0
```

The output lists all of the machines that you created.

### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-8b2br 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

### NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

### NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

**1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

#### NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

#### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

**1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS   ROLES    AGE   VERSION
master-0 Ready    master   73m   v1.23.0
```

```

master-1 Ready   master 73m v1.23.0
master-2 Ready   master 74m v1.23.0
worker-0 Ready   worker 11m v1.23.0
worker-1 Ready   worker 11m v1.23.0

```

## NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 5.14.20. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

#### Prerequisites

- Your control plane has initialized.

#### Procedure

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

#### Example output

NAME	VERSION	AVAILABLE	PROGRESSING	DEGRADED	SINCE
authentication	4.10.0	True	False	False	19m
baremetal	4.10.0	True	False	False	37m

storage	4.10.0	True	False	False	37m

2. Configure the Operators that are not available.

### 5.14.20.1. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

#### Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
  -p [{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]
```

#### TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

### 5.14.20.2. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

#### 5.14.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

## Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY\_STORAGE\_S3\_ACCESSKEY**
  - **REGISTRY\_STORAGE\_S3\_SECRETKEY**

## Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

### Example configuration

```
storage:
  s3:
    bucket: <bucket-name>
    region: <region-name>
```

### WARNING

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

#### 5.14.20.2.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

## Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}'
```

**WARNING**

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

### 5.14.21. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

#### Prerequisites

- You completed the initial Operator configuration for your cluster.

#### Procedure

- Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):

- Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

**1** **<name>** is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

### 5.14.22. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

## Procedure

1. Determine the routes to create.

- To create a wildcard record, use `*.apps.<cluster_name>.<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.
- To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
{"\n"}{end}{end}' routes
```

### Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

### Example output

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)
router-default	LoadBalancer	172.30.62.215	ab3...28.us-east-2.elb.amazonaws.com	80:31499/TCP,443:30693/TCP
		5m		

3. Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName ==
"<external_ip>").CanonicalHostedZoneNameID' 1
```

- 1** For `<external_ip>`, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

### Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
```

```

--dns-name "<domain_name>" \ 1
--query 'HostedZones[? Config.PrivateZone != `true` && Name ==
`<domain_name>.`].Id' 2
--output text

```

- 1 For **<domain\_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

### Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

5. Add the alias records to your private zone:

```

$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", 2
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", 3
>       "DNSName": "<external_ip>.", 4
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'

```

- 1 For **<private\_hosted\_zone\_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```

$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {

```

```

>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", ❷
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", ❸
>       "DNSName": "<external_ip>.", ❹
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'

```

- ❶ For **<public\_hosted\_zone\_id>**, specify the public hosted zone for your domain.
- ❷ For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- ❸ For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- ❹ For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

### 5.14.23. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

#### Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

#### Procedure

1. From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete ❶
```

- ❶ For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

#### Example output

```

INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export

```

```
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 1s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Register your cluster on the [Cluster registration](#) page.

### 5.14.24. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

## NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the `<installation_directory>/openshift_install.log` log file on the installation host.

**Example output**

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

**5.14.25. Telemetry access for OpenShift Container Platform**

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service

**5.14.26. Additional resources**

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

**5.14.27. Next steps**

- [Validate an installation.](#)
- [Customize your cluster.](#)
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#) .
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, see [Registering your disconnected cluster](#)

- If necessary, you can [remove cloud provider credentials](#).

## 5.15. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

### 5.15.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

#### NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

#### Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

#### Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```

$ ./openshift-install destroy cluster \
--dir <installation_directory> --log-level info 1 2

```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

1. Optional: Delete the **<installation\_directory>** directory and the OpenShift Container Platform installation program.

### 5.15.2. Deleting AWS resources with the Cloud Credential Operator utility

To clean up resources after uninstalling an OpenShift Container Platform cluster with the Cloud Credential Operator (CCO) in manual mode with STS, you can use the CCO utility (**ccoctl**) to remove the AWS resources that **ccoctl** created during installation.

#### Prerequisites

- Extract and prepare the **ccoctl** binary.
- Install an OpenShift Container Platform cluster with the CCO in manual mode with STS.

## Procedure

- Delete the AWS resources that **ccoctl** created:

```
$ ccoctl aws delete \
  --name=<name> \ 1
  --region=<aws_region> 2
```

**1** **<name>** matches the name that was originally used to create and tag the cloud resources.

**2** **<aws\_region>** is the AWS region in which to delete cloud resources.

## Example output:

```
2021/04/08 17:50:41 Identity Provider object .well-known/openid-configuration deleted from
the bucket <name>-oidc
2021/04/08 17:50:42 Identity Provider object keys.json deleted from the bucket <name>-oidc
2021/04/08 17:50:43 Identity Provider bucket <name>-oidc deleted
2021/04/08 17:51:05 Policy <name>-openshift-cloud-credential-operator-cloud-credential-o
associated with IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o
deleted
2021/04/08 17:51:05 IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-
o deleted
2021/04/08 17:51:07 Policy <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
associated with IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials deleted
2021/04/08 17:51:07 IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
deleted
2021/04/08 17:51:08 Policy <name>-openshift-image-registry-installer-cloud-credentials
associated with IAM Role <name>-openshift-image-registry-installer-cloud-credentials
deleted
2021/04/08 17:51:08 IAM Role <name>-openshift-image-registry-installer-cloud-credentials
deleted
2021/04/08 17:51:09 Policy <name>-openshift-ingress-operator-cloud-credentials associated
with IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:10 IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:11 Policy <name>-openshift-machine-api-aws-cloud-credentials associated
with IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
2021/04/08 17:51:11 IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
2021/04/08 17:51:39 Identity Provider with ARN arn:aws:iam::<aws_account_id>:oidc-
provider/<name>-oidc.s3.<aws_region>.amazonaws.com deleted
```

## Verification

- To verify that the resources are deleted, query AWS. For more information, refer to AWS documentation.

## CHAPTER 6. INSTALLING ON AZURE

### 6.1. PREPARING TO INSTALL ON AZURE

#### 6.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 6.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See [Configuring an Azure account](#) for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for Azure](#) for other options.

#### 6.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 6.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when

creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

### 6.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

### 6.1.4. Next steps

- [Configuring an Azure account](#)

## 6.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 6.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

### IMPORTANT

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Default Azure limit	Description
vCPU	40	20 per region	<p>A default cluster requires 40 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>• One bootstrap machine, which is removed after installation</li> <li>• Three control plane machines</li> <li>• Three compute machines</li> </ul> <p>Because the bootstrap machine uses <b>Standard_D4s_v3</b> machines, which use 4 vCPUs, the control plane machines use <b>Standard_D8s_v3</b> virtual machines, which use 8 vCPUs, and the worker machines use <b>Standard_D4s_v3</b> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p>
OS Disk	7		<p>Each cluster machine must have a minimum of 100 GB of storage and 300 IOPS. While these are the minimum supported values, faster storage is recommended for production clusters and clusters with intensive workloads. For more information about optimizing storage for performance, see the page titled "Optimizing storage" in the "Scalability and performance" section.</p>
VNet	1	1000 per region	<p>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</p>
Network interfaces	7	65,536 per region	<p>Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</p>

Component	Number of components required by default	Default Azure limit	Description						
Network security groups	2	5000	<p>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443		
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere								
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443								
Network load balancers	3	1000 per region	<p>Each cluster creates the following <a href="#">load balancers</a>:</p> <table border="1"> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines								
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines								
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines								
Public IP addresses	3		Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7		The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						

Component	Number of components required by default	Default Azure limit	Description
Spot VM vCPUs (optional)	0 If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node.	20 per region	<p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div style="display: flex; align-items: center;">  <div> <p><b>NOTE</b></p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div>

### Additional resources

- [Optimizing storage](#).

## 6.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

#### NOTE

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

## 6.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
  - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
  - b. From the **Subscription** list, select the subscription to modify.
  - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
  - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
  - a. Click **Provide details** and provide the required details in the **Quota details** window.
  - b. In the **SUPPORT METHOD** and **CONTACT INFO** sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

**6.2.4. Required Azure roles**

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, review the following information:

Your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Contributor**

Your Azure Active Directory (AD) must have the following permission:

- **"microsoft.directory/servicePrincipals/createAsOwner"**

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

**6.2.5. Creating a service principal**

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

**Prerequisites**

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

## Procedure

1. Log in to the Azure CLI:

```
$ az login
```

2. If your Azure account uses subscriptions, ensure that you are using the right subscription:
  - a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

### Example output

```
[
  {
    "cloudName": "AzureCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

### Example output

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

- 1** Ensure that the value of the **tenantId** parameter is the correct subscription ID.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> ❶
```

- ❶ Specify the subscription ID.

d. Verify the subscription ID update:

```
$ az account show
```

### Example output

```
{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

3. Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.
4. Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ ❶
--scopes /subscriptions/<subscription_id> ❷
--years <years> ❸
```

- ❶ Specify the service principal name.
- ❷ Specify the subscription ID.
- ❸ Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

### Example output

```
Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not
include these credentials in your code or check the credentials into your source
control. For more information, see https://aka.ms/azadsp-cli
{
  "appId": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}
```

- Record the values of the **appld** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.
- Assign the **User Access Administrator** role by running the following command:

```
$ az role assignment create --role "User Access Administrator" \  
--assignee-object-id $(az ad sp show --id <appld> --query id -o tsv) 1
```

- Specify the **appld** parameter value for your service principal.

### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

## 6.2.6. Supported Azure Marketplace regions

Installing a cluster by using the Azure Marketplace image is available to customers who purchase the offer in North America and EMEA.

While the offer must be purchased in North America or EMEA, you can deploy the cluster to any of the Azure public partitions that OpenShift Container Platform supports.

### NOTE

Deploying a cluster by using the Azure Marketplace image is not supported for the Azure Government regions.

## 6.2.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

### Supported Azure public regions

- australiacentral** (Australia Central)
- australiaeast** (Australia East)
- australiasoutheast** (Australia South East)
- brazilsouth** (Brazil South)
- canadacentral** (Canada Central)
- canadaeast** (Canada East)
- centralindia** (Central India)
- centralus** (Central US)
- eastasia** (East Asia)
- eastus** (East US)
- eastus2** (East US 2)

- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **qatarcentral** (Qatar Central)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **swedencentral** (Sweden Central)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)
- **westus3** (West US 3)

#### Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 6.2.8. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can [install a customized cluster](#) or [quickly install a cluster](#) with default options.

## 6.3. MANUALLY CREATING IAM FOR AZURE

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

### 6.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can set the **credentialsMode** parameter for the CCO to **Manual** when installing OpenShift Container Platform and manage your cloud credentials manually.

Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

#### Additional resources

- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

### 6.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

#### Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

### Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
  --credentials-requests \
  --cloud=azure
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
```

```

roleBindings:
- role: Contributor
...

```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample CredentialsRequest object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
      ...
    secretRef:
      name: <component-secret>
      namespace: <component-namespace>
    ...

```

### Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component-secret>
  namespace: <component-namespace>
data:
  azure_subscription_id: <base64_encoded_azure_subscription_id>
  azure_client_id: <base64_encoded_azure_client_id>
  azure_client_secret: <base64_encoded_azure_client_secret>
  azure_tenant_id: <base64_encoded_azure_tenant_id>
  azure_resource_prefix: <base64_encoded_azure_resource_prefix>
  azure_resourcegroup: <base64_encoded_azure_resourcegroup>
  azure_region: <base64_encoded_azure_region>

```

## IMPORTANT

The release image includes **CredentialsRequest** objects for Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set. You can identify these objects by their use of the **release.openshift.io/feature-gate: TechPreviewNoUpgrade** annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.
- If you are using any of these features, you must create secrets for the corresponding objects.

- To find **CredentialsRequest** objects with the **TechPreviewNoUpgrade** annotation, run the following command:

```
$ grep "release.openshift.io/feature-gate" *
```

### Example output

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate:
TechPreviewNoUpgrade
```

7. From the directory that contains the installation program, proceed with your cluster creation:

```
$ openshift-install create cluster --dir <installation_directory>
```

## IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

### Additional resources

- [Updating a cluster using the web console](#)
- [Updating a cluster using the CLI](#)

### 6.3.3. Next steps

- Install an OpenShift Container Platform cluster:
  - [Installing a cluster quickly on Azure](#) with default options on installer-provisioned infrastructure
  - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)

## 6.4. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure that uses the default configuration options.

### 6.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 6.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

■

```
$ eval "$(ssh-agent -s)"
```

### Example output

```
Agent pid 31874
```

### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 6.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

## IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

## IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

## NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **azure** as the platform to target.
- c. If the installation program cannot locate the **osServicePrincipal.json** configuration file, which contains Microsoft Azure profile information, in the **~/.azure/** directory on your computer, the installer prompts you to specify the following Azure parameter values for your subscription and service principal.
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantid** value in your account output.
  - **azure service principal client id** The value of the **appid** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.

## IMPORTANT

After you enter values for the previously listed parameters, the installation program creates a **osServicePrincipal.json** configuration file and stores this file in the **~/.azure/** directory on your computer. These actions ensure that the installation program can load the profile when it is creating an OpenShift Container Platform cluster on the target platform.

- d. Select the region to deploy the cluster to.
- e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- f. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- g. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 6.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 6.4.9. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 6.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 6.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 6.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 6.5.4. Selecting an Azure Marketplace image

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.
- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

### Prerequisites

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

### Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

### Example output

Offer	Publisher	Sku	Urn	Version
rh-ocp-worker-ocpworker:4.8.2021122100	RedHat	rh-ocp-worker	RedHat:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	
rh-ocp-worker-gen1:4.8.2021122100	RedHat	rh-ocp-worker-gen1	RedHat:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

### Example output

Offer	Publisher	Sku	Urn	Version
rh-ocp-worker	redhat-limited	rh-ocp-worker	redhat-limited:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	4.8.2021122100
rh-ocp-worker-gen1	redhat-limited	rh-ocp-worker-gen1	redhat-limited:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	4.8.2021122100

### NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

- North America:

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

3. Review the terms of the offer by running one of the following commands:

- North America:

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

4. Accept the terms of the offering by running one of the following commands:

- North America:

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

- Record the image details of your offer. You must update the **99\_openshift-cluster-api\_worker-machineset-[0-2].yaml** files in the section titled "Updating Manifests for Marketplace Installation" before completing the installation.

### 6.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

- Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
- Select your infrastructure provider.
- Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

- Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.

- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 6.5.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 6.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 6.1. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

Parameter	Description	Values
-----------	-------------	--------

### 6.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 6.2. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 6.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.3. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.	<b>Enabled</b> or <b>Disabled</b>
	 <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	

Parameter	Description	Values
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="background-color: black; width: 40px; height: 40px; margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or {}
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint, Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="486 584 592 1361" style="background-color: black; color: white; padding: 5px; margin-bottom: 10px;"> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> <div data-bbox="486 1406 592 1608" style="background-color: #f0f0f0; padding: 5px;"> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	<b>false</b> or <b>true</b>

Parameter	Description	Values
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 6.5.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

Table 6.4. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster by using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .

Parameter	Description	Values
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"].
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 6.5.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.5. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 <sup>[3]</sup>	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 6.5.6.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

##### Example 6.1. Machine types

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***

- r4.\*
- r5.\*
- r5a.\*
- r6i.\*
- t3.\*
- t3a.\*

#### 6.5.6.4. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:

```

```

- cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: centralus 12
    resourceGroupName: existing_resource_group 13
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 14
fips: false 15
sshKey: ssh-ed25519 AAAA... 16

```

- 1 10 12 14 Required. The installation program prompts you for this value.
- 2 6 If you do not provide these parameters and values, the installation program provides the default value.
- 3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

## IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

16

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

## NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### 6.5.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
```

```
additionalTrustBundle: | 4
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.5.7. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding **acceleratedNetworking** to your machine set YAML file before you install the cluster.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

## Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

## Example output

```
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.azure/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: installation_directory/manifests and
installation_directory/openshift
```

- Change to the **openshift** directory within the directory that contains the installation program. The **openshift** directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

## Machine set files in openshift directory listing

```
99_openshift-cluster-api_worker-machineset-0.yaml
99_openshift-cluster-api_worker-machineset-1.yaml
99_openshift-cluster-api_worker-machineset-2.yaml
```

- Add the following to the **providerSpec** field in each machine set file:

```
providerSpec:
  value:
    ...
    acceleratedNetworking: true 1
    ...
    vmSize: <azure-vm-size> 2
    ...
```

- 1** This line enables Accelerated Networking.
- 2** Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see [Microsoft Azure documentation](#).

## Additional resources

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](#).

## 6.5.8. Updating manifests for Marketplace installation

If you selected a Marketplace image for installation, you must create and modify the manifests to use the Marketplace image.

## Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

## Procedure

1. Change to the directory that contains the installation program and create the manifests by running the following command:

```
$ openshift-install create manifests --dir <installation_dir>
```

2. Edit the **.spec.template.spec.providerSpec.value.image** property of the compute machine set definitions, replacing the **offer**, **publisher**, **sku**, and **version** values with the details gathered in the section titled "Selecting an Azure Marketplace image". These are the three files that must be updated:

- **<installation\_dir>/openshift/99\_openshift-cluster-api\_worker-machineset-0.yaml**
- **<installation\_dir>/openshift/99\_openshift-cluster-api\_worker-machineset-1.yaml**
- **<installation\_dir>/openshift/99\_openshift-cluster-api\_worker-machineset-2.yaml**

3. In each file, replace the value of the **.spec.template.spec.providerSpec.value.image.resourceID** property with an empty value (**""**).
4. In each file, set the **type** property to **MarketplaceWithPlan**.
5. Using the first machine set file as an example, the **.spec.template.spec.providerSpec.value.image** section must look like the following example:

```
image:
  offer: rh-ocp-worker
  publisher: redhat
  resourceID: ""
  sku: rh-ocp-worker
  version: 4.8.2021122100
  type: MarketplaceWithPlan
```

## 6.5.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

## Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ ❶
--log-level=info ❷
```

- ❶ For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- ❷ To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/./openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**6.5.10. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.5.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 6.5.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 6.5.13. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 6.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.10, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### 6.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#). Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

### 6.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the

installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.6.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 6.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 6.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 6.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 6.6. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object

Parameter	Description	Values
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 6.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.7. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:   - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

### 6.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 6.8. Optional parameters**

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 6.6.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

Table 6.9. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSize GB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .

Parameter	Description	Values
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster by using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .

Parameter	Description	Values
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 6.6.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.10. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 6.6.5.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

##### Example 6.2. Machine types

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

#### 6.6.5.4. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 12
    region: centralus 13

```

```
resourceGroupName: existing_resource_group 14
outboundType: Loadbalancer
cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 15
fips: false 16
sshKey: ssh-ed25519 AAAA... 17
```

- 1 10 13 15 Required. The installation program prompts you for this value.
- 2 6 11 If you do not provide these parameters and values, the installation program provides the default value.
- 3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 12 Specify the name of the resource group that contains the DNS zone for your base domain.
- 14 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

**6.6.5.5. Configuring the cluster-wide proxy during installation**

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

**Prerequisites**

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

**Procedure**

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

**1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

**2** A proxy URL to use for creating HTTPS connections outside the cluster.

- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.6.6. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

**IMPORTANT**

The CIDR range **172.17.0.0/16** is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

**Phase 2**

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

**6.6.7. Specifying advanced network configuration**

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

**Prerequisites**

- You have created the **install-config.yaml** file and completed any modifications to it.

**Procedure**

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

### Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

## 6.6.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

### **clusterNetwork**

IP address pools from which pod IP addresses are allocated.

### **serviceNetwork**

IP address pool for services.

### **defaultNetwork.type**

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

### 6.6.8.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 6.11. Cluster Network Operator configuration object**

Field	Type	Description
<b>metadata.name</b>	<b>string</b>	The name of the CNO object. This name is always <b>cluster</b> .
<b>spec.clusterNetwork</b>	<b>array</b>	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:   - cidr: 10.128.0.0/19     hostPrefix: 23   - cidr: 10.128.32.0/19     hostPrefix: 23</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.serviceNetwork</b>	<b>array</b>	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:   - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.defaultNetwork</b>	<b>object</b>	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
<b>spec.kubeProxy</b> <b>Config</b>	<b>object</b>	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

### defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 6.12. **defaultNetwork** object

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>type</b>	<b>string</b>	<p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
<b>openshiftSDNConfig</b>	<b>object</b>	This object is only valid for the OpenShift SDN cluster network provider.
<b>ovnKubernetesConfig</b>	<b>object</b>	This object is only valid for the OVN-Kubernetes cluster network provider.

#### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 6.13. openshiftSDNConfig object**

Field	Type	Description
<b>mode</b>	<b>string</b>	<p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>vxlanPort</b>	<b>integer</b>	<p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>

### Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 6.14. `ovnKubernetesConfig` object

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p>
<b>genevePort</b>	<b>integer</b>	The port to use for all Geneve packets. The default value is <b>6081</b> . This value cannot be changed after cluster installation.
<b>ipsecConfig</b>	<b>object</b>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<b>policyAuditConfig</b>	<b>object</b>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.
<b>gatewayConfig</b>	<b>object</b>	<p>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.</p> </div> </div>

Table 6.15. **policyAuditConfig** object

Field	Type	Description
<b>rateLimit</b>	integer	The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second.
<b>maxFileSize</b>	integer	The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.

Field	Type	Description
<b>destination</b>	string	<p>One of the following additional audit log targets:</p> <p><b>libc</b> The libc <b>syslog()</b> function of the journald process on the host.</p> <p><b>udp:&lt;host&gt;:&lt;port&gt;</b> A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server.</p> <p><b>unix:&lt;file&gt;</b> A Unix Domain Socket file specified by <b>&lt;file&gt;</b>.</p> <p><b>null</b> Do not send the audit logs to any additional target.</p>
<b>syslogFacility</b>	string	The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .

Table 6.16. gatewayConfig object

Field	Type	Description
<b>routingViaHost</b>	<b>boolean</b>	<p>Set this field to <b>true</b> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <b>false</b>.</p> <p>This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <b>true</b>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</p>

### Example OVN-Kubernetes configuration with IPsec enabled

```

defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}

```

### kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 6.17. kubeProxyConfig object

Field	Type	Description
<b>iptablesSyncPeriod</b>	<b>string</b>	<p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div>
<b>proxyArguments.iptables-min-sync-period</b>	<b>array</b>	<p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>

### 6.6.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

#### IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

#### Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

#### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  EOF
```

where:

**<installation\_directory>**

Specifies the directory name that contains the **manifests/** directory for your cluster.

3. Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

**Specify a hybrid networking configuration**

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
        hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- 1 Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.
- 2 Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

**NOTE**

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

## NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

### 6.6.10. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding **acceleratedNetworking** to your machine set YAML file before you install the cluster.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.
- You have created the manifests for your cluster.

#### Procedure

1. Change to the **openshift** directory within the directory that contains the installation program. The **openshift** directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

#### Machine set files in **openshift** directory listing

```
99_openshift-cluster-api_worker-machineset-0.yaml
99_openshift-cluster-api_worker-machineset-1.yaml
99_openshift-cluster-api_worker-machineset-2.yaml
```

2. Add the following to the **providerSpec** field in each machine set file:

```
providerSpec:
  value:
    ...
    acceleratedNetworking: true 1
    ...
    vmSize: <azure-vm-size> 2
    ...
```

- 1 This line enables Accelerated Networking.
- 2 Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see [Microsoft Azure documentation](#).

#### Additional resources

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](#).

## 6.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 6.6.12. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.

To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.

To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.

To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.6.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 6.6.15. Next steps

- [Customize your cluster](#).

- If necessary, you can [opt out of remote health reporting](#) .

## 6.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

In OpenShift Container Platform version 4.10, you can install a cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 6.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### 6.7.2. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.10, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

#### 6.7.2.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within a region. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

#### NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

#### 6.7.2.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

## IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 6.18. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

## IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### Additional resources

- [About the OpenShift SDN network plugin](#)

### 6.7.2.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application

resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

### 6.7.2.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

## 6.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 6.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1** Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**6.7.5. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

#### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

#### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 6.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### 6.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 6.19. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 6.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.20. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 6.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.21. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.	<b>Enabled</b> or <b>Disabled</b>
	 <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	

Parameter	Description	Values
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 30px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or {}
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint, Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="486 584 593 1361" style="background-color: black; color: white; padding: 5px; margin-bottom: 10px;"> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> <div data-bbox="486 1406 593 1608" style="background-color: black; color: white; padding: 5px;"> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	<b>false</b> or <b>true</b>

Parameter	Description	Values
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	The SSH key or keys to authenticate access your cluster machines.   <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	One or more keys. For example:  <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 6.7.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

Table 6.22. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster by using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .

Parameter	Description	Values
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"].
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 6.7.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.23. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 6.7.6.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

##### Example 6.3. Machine types

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***

- r4.\*
- r5.\*
- r5a.\*
- r6i.\*
- t3.\*
- t3a.\*

#### 6.7.6.4. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:

```

```

- cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: centralus 12
    resourceGroupName: existing_resource_group 13
    networkResourceGroupName: vnet_resource_group 14
    virtualNetwork: vnet 15
    controlPlaneSubnet: control_plane_subnet 16
    computeSubnet: compute_subnet 17
    outboundType: Loadbalancer
    cloudName: AzurePublicCloud
  pullSecret: '{"auths": ...}' 18
  fips: false 19
  sshKey: ssh-ed25519 AAAA... 20

```

1 10 12 18 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11 Specify the name of the resource group that contains the DNS zone for your base domain.

13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

- 14 If you use an existing VNet, specify the name of the resource group that contains it.
- 15 If you use an existing VNet, specify its name.
- 16 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 17 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 19 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 20 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 6.7.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.7.7. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding **acceleratedNetworking** to your machine set YAML file before you install the cluster.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.
- You have created the manifests for your cluster.

#### Procedure

1. Change to the **openshift** directory within the directory that contains the installation program. The **openshift** directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

#### Machine set files in **openshift** directory listing

```
99_openshift-cluster-api_worker-machineset-0.yaml
99_openshift-cluster-api_worker-machineset-1.yaml
99_openshift-cluster-api_worker-machineset-2.yaml
```

2. Add the following to the **providerSpec** field in each machine set file:

```
providerSpec:
  value:
    ...
    acceleratedNetworking: true 1
    ...
    vmSize: <azure-vm-size> 2
    ...
```

- 1** This line enables Accelerated Networking.

- 2 Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see [Microsoft Azure documentation](#).

### Additional resources

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](#).

## 6.7.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
```

```

KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

## NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 6.7.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.7.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 6.7.12. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 6.8. INSTALLING A PRIVATE CLUSTER ON AZURE

In OpenShift Container Platform version 4.10, you can install a private cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 6.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### 6.8.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

#### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.

- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 6.8.2.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster's private DNS records. The cluster's machines use **168.63.129.16** internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 6.8.2.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

### 6.8.2.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the **install-config.yaml** file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an OpenShift image registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the *Configuring your firewall* section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

#### **Private cluster with network address translation**

You can use [Azure VNET network address translation \(NAT\)](#) to provide outbound internet access for the subnets in your cluster. You can reference [Create a NAT gateway using Azure CLI](#) in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

#### **Private cluster with Azure Firewall**

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about [providing user-defined routing with Azure Firewall](#) in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

#### **Private cluster with a proxy configuration**

You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with **0.0.0.0/0** populated automatically by Azure, all Azure API requests are routed over Azure's internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

#### **Private cluster with no internet access**

You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An OpenShift image registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

### 6.8.3. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.10, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

#### 6.8.3.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICs for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

**NOTE**

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for.

**NOTE**

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

**6.8.3.1.1. Network security group requirements**

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

**IMPORTANT**

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

**Table 6.24. Required ports**

Port	Description	Control plane	Compute
<b>80</b>	Allows HTTP traffic		x
<b>443</b>	Allows HTTPS traffic		x
<b>6443</b>	Allows communication to the control plane machines	x	
<b>22623</b>	Allows internal communication to the machine config server for provisioning machines	x	

## IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### Additional resources

- [About the OpenShift SDN network plugin](#)

### 6.8.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

### 6.8.3.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

### 6.8.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

**6.8.5. Generating a key pair for cluster node SSH access**

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Progress cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 6.8.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

## Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 6.8.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

## Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

**Procedure**

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

**NOTE**

You must name this configuration file **install-config.yaml**.

**NOTE**

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation\_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

**6.8.7.1. Installation configuration parameters**

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**6.8.7.1.1. Required configuration parameters**

Required installation configuration parameters are described in the following table:

**Table 6.25. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 6.8.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.26. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 6.8.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.27. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.	<b>Enabled</b> or <b>Disabled</b>
	 <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	

Parameter	Description	Values
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>

Parameter	Description	Values
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p> </div> </div>	<b>Mint, Passthrough, Manual</b> or an empty string ( <b>""</b> ).

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div data-bbox="486 584 592 1361" style="background-color: black; color: white; padding: 5px; margin-bottom: 10px;"> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> <div data-bbox="486 1406 592 1608" style="background-color: black; color: white; padding: 5px;"> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	<b>false</b> or <b>true</b>

Parameter	Description	Values
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 6.8.7.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

Table 6.28. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster by using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .

Parameter	Description	Values
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example ["1", "2", "3"].
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 6.8.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.29. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 6.8.7.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

##### Example 6.4. Machine types

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***

- r4.\*
- r5.\*
- r5a.\*
- r6i.\*
- t3.\*
- t3a.\*

#### 6.8.7.4. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:

```

```

- cidr: 10.128.0.0/14
  hostPrefix: 23
machineNetwork:
- cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
- 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: centralus 12
    resourceGroupName: existing_resource_group 13
    networkResourceGroupName: vnet_resource_group 14
    virtualNetwork: vnet 15
    controlPlaneSubnet: control_plane_subnet 16
    computeSubnet: compute_subnet 17
    outboundType: UserDefinedRouting 18
    cloudName: AzurePublicCloud
  pullSecret: '{"auths": ...}' 19
  fips: false 20
  sshKey: ssh-ed25519 AAAA... 21
  publish: Internal 22

```

1 10 12 19 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11 Specify the name of the resource group that contains the DNS zone for your base domain.

13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

- 14 If you use an existing VNet, specify the name of the resource group that contains it.
- 15 If you use an existing VNet, specify its name.
- 16 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 17 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 18 You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 6.8.7.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.8.8. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding **acceleratedNetworking** to your machine set YAML file before you install the cluster.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.
- You have created the manifests for your cluster.

#### Procedure

1. Change to the **openshift** directory within the directory that contains the installation program. The **openshift** directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

#### Machine set files in **openshift** directory listing

```
99_openshift-cluster-api_worker-machineset-0.yaml
99_openshift-cluster-api_worker-machineset-1.yaml
99_openshift-cluster-api_worker-machineset-2.yaml
```

2. Add the following to the **providerSpec** field in each machine set file:

```
providerSpec:
  value:
    ...
    acceleratedNetworking: true 1
    ...
    vmSize: <azure-vm-size> 2
    ...
```

- 1** This line enables Accelerated Networking.

- 2 Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see [Microsoft Azure documentation](#).

### Additional resources

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](#).

## 6.8.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```

$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2

```

1 For **<installation\_directory>**, specify the

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```

...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'

```

INFO Access the OpenShift web-console here: <https://console-openshift-console.apps.mycluster.example.com>  
 INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"  
 INFO Time elapsed: 36m22s

## NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 6.8.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.

4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.8.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 6.8.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 6.8.13. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 6.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure into a government region. To configure the government region, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 6.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated government region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### 6.9.2. Azure government regions

OpenShift Container Platform supports deploying a cluster to [Microsoft Azure Government \(MAG\)](#) regions. MAG is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure. MAG is composed of government-only data center regions, all granted an [Impact Level 5 Provisional Authorization](#).

Installing to a MAG region requires manually configuring the Azure Government dedicated cloud instance and region in the **install-config.yaml** file. You must also update your service principal to reference the appropriate government environment.

#### NOTE

The Azure government region cannot be selected using the guided terminal prompts from the installation program. You must define the region manually in the **install-config.yaml** file. Remember to also set the dedicated cloud instance, like **AzureUSGovernmentCloud**, based on the region specified.

### 6.9.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

#### 6.9.3.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster's private DNS records. The cluster's machines use **168.63.129.16** internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 6.9.3.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

#### 6.9.3.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the **install-config.yaml** file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an OpenShift image registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the *Configuring your firewall* section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

##### Private cluster with network address translation

You can use [Azure VNET network address translation \(NAT\)](#) to provide outbound internet access for the subnets in your cluster. You can reference [Create a NAT gateway using Azure CLI](#) in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

##### Private cluster with Azure Firewall

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about [providing user-defined routing with Azure Firewall](#) in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

##### Private cluster with a proxy configuration

You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with **0.0.0.0/0** populated automatically by Azure, all Azure API requests are routed over Azure's internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

#### Private cluster with no internet access

You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An OpenShift image registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

### 6.9.4. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.10, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

#### 6.9.4.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICs for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

#### NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

#### 6.9.4.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

#### IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 6.30. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

### IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

#### Additional resources

- [About the OpenShift SDN network plugin](#)

#### 6.9.4.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

#### 6.9.4.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

### 6.9.5. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.9.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 6.9.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform

components.

### 6.9.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure into a government region, you must manually generate your installation configuration file.

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 6.9.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**6.9.8.1.1. Required configuration parameters**

Required installation configuration parameters are described in the following table:

**Table 6.31. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;. &lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .

Parameter	Description	Values
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 6.9.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 6.32. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:   - cidr: 10.128.0.0/14     hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:   - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:   - cidr: 10.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

### 6.9.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 6.33. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>

Parameter	Description	Values
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 6.9.8.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table.

#### NOTE

By default, if you specify availability zones in the **install-config.yaml** file, the installation program distributes the control plane machines and the compute machines across [these availability zones](#) within [a region](#). To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.

Table 6.34. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSize GB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .

Parameter	Description	Values
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster by using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zones</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .

Parameter	Description	Values
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 6.9.8.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 6.35. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 6.9.8.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

##### Example 6.5. Machine types

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6i.\***
- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

#### 6.9.8.4. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    baseDomainResourceGroupName: resource_group 11
    region: usgovvirginia
    resourceGroupName: existing_resource_group 12

```

```

networkResourceGroupName: vnet_resource_group 13
virtualNetwork: vnet 14
controlPlaneSubnet: control_plane_subnet 15
computeSubnet: compute_subnet 16
outboundType: UserDefinedRouting 17
cloudName: AzureUSGovernmentCloud 18
pullSecret: '{"auths": ...}' 19
fips: false 20
sshKey: ssh-ed25519 AAAA... 21
publish: Internal 22

```

- 1 10 19 Required.
- 2 6 If you do not provide these parameters and values, the installation program provides the default value.
- 3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 12 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 13 If you use an existing VNet, specify the name of the resource group that contains it.
- 14 If you use an existing VNet, specify its name.
- 15 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 16 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 17 You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying your cluster to an existing VNet.

- 18 Specify the name of the Azure cloud environment to deploy your cluster to. Set **AzureUSGovernmentCloud** to deploy to a Microsoft Azure Government (MAG) region. The
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 6.9.8.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.9.9. Enabling Accelerated Networking during installation

You can enable Accelerated Networking on Microsoft Azure by adding **acceleratedNetworking** to your machine set YAML file before you install the cluster.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.
- You have created the manifests for your cluster.

#### Procedure

1. Change to the **openshift** directory within the directory that contains the installation program. The **openshift** directory contains the Kubernetes manifest files that define the worker machines. These are the three default machine set files for an Azure cluster:

#### Machine set files in **openshift** directory listing

```
99_openshift-cluster-api_worker-machineset-0.yaml
99_openshift-cluster-api_worker-machineset-1.yaml
99_openshift-cluster-api_worker-machineset-2.yaml
```

2. Add the following to the **providerSpec** field in each machine set file:

```
providerSpec:
  value:
    ...
    acceleratedNetworking: true 1
    ...
    vmSize: <azure-vm-size> 2
    ...
```

- 1** This line enables Accelerated Networking.
- 2** Specify an Azure VM size that includes at least four vCPUs. For information about VM sizes, see [Microsoft Azure documentation](#).

#### Additional resources

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](#).

### 6.9.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

## IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ ❶
--log-level=info ❷
```

- ❶ For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- ❷ To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

## NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**6.9.11. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.9.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 6.9.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 6.9.14. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 6.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure by using infrastructure that you provide.

Several [Azure Resource Manager \(ARM\)](#) templates are provided to assist in completing these steps or to help model your own.

### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

#### 6.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See [Install the Azure CLI](#) in the Azure documentation. The documentation below was last tested using version **2.38.0** of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### NOTE

Be sure to also review this site list if you are configuring a proxy.

#### 6.10.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

**6.10.3. Configuring your Azure project**

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

**6.10.3.1. Azure account limits**

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

**IMPORTANT**

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Default Azure limit	Description

Component	Number of components required by default	Default Azure limit	Description
vCPU	40	20 per region	<p>A default cluster requires 40 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>• One bootstrap machine, which is removed after installation</li> <li>• Three control plane machines</li> <li>• Three compute machines</li> </ul> <p>Because the bootstrap machine uses <b>Standard_D4s_v3</b> machines, which use 4 vCPUs, the control plane machines use <b>Standard_D8s_v3</b> virtual machines, which use 8 vCPUs, and the worker machines use <b>Standard_D4s_v3</b> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p>
OS Disk	7		<p>Each cluster machine must have a minimum of 100 GB of storage and 300 IOPS. While these are the minimum supported values, faster storage is recommended for production clusters and clusters with intensive workloads. For more information about optimizing storage for performance, see the page titled "Optimizing storage" in the "Scalability and performance" section.</p>
VNet	1	1000 per region	<p>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</p>
Network interfaces	7	65,536 per region	<p>Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</p>

Component	Number of components required by default	Default Azure limit	Description						
Network security groups	2	5000	<p>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443		
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere								
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443								
Network load balancers	3	1000 per region	<p>Each cluster creates the following <a href="#">load balancers</a>:</p> <table border="1"> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines								
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines								
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines								
Public IP addresses	3		Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7		The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						

Component	Number of components required by default	Default Azure limit	Description
Spot VM vCPUs (optional)	0 If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node.	20 per region	<p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div style="display: flex; align-items: center;">  <div> <p><b>NOTE</b></p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div>

### Additional resources

- [Optimizing storage](#).

### 6.10.3.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

#### NOTE

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

You can view Azure's DNS solution by visiting this [example for creating DNS zones](#).

### 6.10.3.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
  - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
  - b. From the **Subscription** list, select the subscription to modify.
  - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
  - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
  - a. Click **Provide details** and provide the required details in the **Quota details** window.
  - b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

#### 6.10.3.4. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

#### 6.10.3.5. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, review the following information:

Your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Contributor**

Your Azure Active Directory (AD) must have the following permission:

- **"microsoft.directory/servicePrincipals/createAsOwner"**

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

### 6.10.3.6. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

#### Prerequisites

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

#### Procedure

1. Log in to the Azure CLI:

```
$ az login
```

2. If your Azure account uses subscriptions, ensure that you are using the right subscription:

- a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

#### Example output

```
[
  {
    "cloudName": "AzureCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

#### Example output

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
```

```
"tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
"user": {
  "name": "you@example.com",
  "type": "user"
}
}
```

- 1** Ensure that the value of the **tenantId** parameter is the correct subscription ID.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> 1
```

- 1** Specify the subscription ID.

- d. Verify the subscription ID update:

```
$ az account show
```

#### Example output

```
{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

3. Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.
4. Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ 1
--scopes /subscriptions/<subscription_id> 2
--years <years> 3
```

- 1** Specify the service principal name.

- 2** Specify the subscription ID.

- 3** Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

#### Example output

Creating 'Contributor' role assignment under scope '/subscriptions/<subscription\_id>' The output includes credentials that you must protect. Be sure that you do not include these credentials in your code or check the credentials into your source control. For more information, see <https://aka.ms/azadsp-cli>

```
{
  "appld": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}
```

- Record the values of the **appld** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.
- Assign the **User Access Administrator** role by running the following command:

```
$ az role assignment create --role "User Access Administrator" \
  --assignee-object-id $(az ad sp show --id <appld> --query id -o tsv) 1
```

- Specify the **appld** parameter value for your service principal.

#### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

#### 6.10.3.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

##### Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)

- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **qatarcentral** (Qatar Central)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **swedencentral** (Sweden Central)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)
- **westus3** (West US 3)

#### Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

## 6.10.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

### 6.10.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 6.36. Minimum required hosts**

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

#### IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.4, or RHEL 8.5.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

### 6.10.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 6.37. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 8.4, or RHEL 8.5 <sup>[3]</sup>	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

#### 6.10.4.3. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

##### Example 6.6. Machine types

- c4.\*
- c5.\*
- c5a.\*
- i3.\*
- m4.\*
- m5.\*
- m5a.\*
- m6i.\*
- r4.\*

- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 6.10.5. Selecting an Azure Marketplace image

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.
- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

#### Prerequisites

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

#### Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

#### Example output

Offer	Publisher	SKU	Urn	Version
rh-ocp-worker-ocpworker:4.8.2021122100	RedHat	rh-ocp-worker	RedHat:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	
rh-ocp-worker-gen1:4.8.2021122100	RedHat	rh-ocp-worker-gen1	RedHat:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

### Example output

```
Offer          Publisher      Sku              Urn                                                       Version
-----
rh-ocp-worker redhat-limited rh-ocp-worker    redhat-limited:rh-ocp-worker:rh-ocp-                    4.8.2021122100
worker:4.8.2021122100 4.8.2021122100
rh-ocp-worker redhat-limited rh-ocp-worker-gen1 redhat-limited:rh-ocp-worker:rh-ocp-                    4.8.2021122100
worker-gen1:4.8.2021122100 4.8.2021122100
```

### NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

- North America:

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

3. Review the terms of the offer by running one of the following commands:

- North America:

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

4. Accept the terms of the offering by running one of the following commands:

- North America:

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

5. Record the image details of your offer and use them to update the **06\_workers.json** Azure Resource Manager (ARM) template.

- Update the **storageProfile.imageReference** field by deleting the **id** parameter and adding the **offer**, **publisher**, **sku**, and **version** parameters by using the values from your offer. You can find a sample template in the "Creating additional worker machines in Azure" section.

### 6.10.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

- Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
- Select your infrastructure provider.
- Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

- Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 6.10.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

### 6.10.8. Creating the installation files for Azure

To install OpenShift Container Platform on Microsoft Azure using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

#### 6.10.8.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.

- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

### Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.10.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
      partitions:
        - label: var
          start_mib: <partition_start_offset> 2
          size_mib: <partition_size> 3
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] 4
          with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

#### NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 6.10.8.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

#### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.

- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
- c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting **install-config.yaml** file to set **replicas** to **0** for the **compute** pool:

```
compute:
- hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 0 1
```

**1** Set to **0**.

2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 6.10.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

## Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the

**trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

#### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 6.10.8.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure.

#### NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Export common variables found in the **install-config.yaml** to be used by the provided ARM templates:

```
$ export CLUSTER_NAME=<cluster_name> 1
$ export AZURE_REGION=<azure_region> 2
$ export SSH_KEY=<ssh_key> 3
$ export BASE_DOMAIN=<base_domain> 4
$ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group> 5
```

- 1 The value of the **.metadata.name** attribute from the **install-config.yaml** file.
- 2 The region to deploy the cluster into, for example **centralus**. This is the value of the **.platform.azure.region** attribute from the **install-config.yaml** file.
- 3 The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the **.sshKey** attribute from the **install-config.yaml** file.
- 4 The base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster. This is the value of the **.baseDomain** attribute from the **install-config.yaml** file.
- 5 The resource group where the public DNS zone exists. This is the value of the **.platform.azure.baseDomainResourceGroupName** attribute from the **install-config.yaml** file.

For example:

```
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster
```

2. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

### 6.10.8.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

## IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

## Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** file.
- b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.

- c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- 1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:
  - a. Export the infrastructure ID by using the following command:

```
$ export INFRA_ID=<infra_id> 1
```

- 1 The OpenShift Container Platform cluster has been assigned an identifier (**INFRA\_ID**) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the **.status.infrastructureName** attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

- b. Export the resource group by using the following command:

```
$ export RESOURCE_GROUP=<resource_group> 1
```

- 1 All resources created in this Azure deployment exists as part of a [resource group](#). The resource group name is also based on the **INFRA\_ID**, in the form of `<cluster_name>-<random_string>-rg`. This is the value of the **.status.platformStatus.azure.resourceGroupName** attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

7. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$. /openshift-install create ignition-configs --dir <installation_directory> 1
```

- 1 For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

### 6.10.9. Creating the Azure resource group

You must create a Microsoft Azure [resource group](#) and an identity for that resource group. These are both used during the installation of your OpenShift Container Platform cluster on Azure.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

#### Procedure

1. Create the resource group in a supported Azure region:

```
$ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
```

2. Create an Azure identity for the resource group:

```
$ az identity create -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity
```

This is used to grant the required access to Operators in your cluster. For example, this allows the Ingress Operator to create a public IP and its load balancer. You must assign the Azure identity to a role.

3. Grant the Contributor role to the Azure identity:

- a. Export the following variables required by the Azure role assignment:

```
$ export PRINCIPAL_ID=`az identity show -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity --query principalId --out tsv`
```

```
$ export RESOURCE_GROUP_ID=`az group show -g ${RESOURCE_GROUP} --query id --out tsv`
```

- b. Assign the Contributor role to the identity:

```
$ az role assignment create --assignee "${PRINCIPAL_ID}" --role 'Contributor' --scope "${RESOURCE_GROUP_ID}"
```

### 6.10.10. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally. You must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

#### Procedure

1. Create an Azure storage account to store the VHD cluster image:

```
$ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
```

#### WARNING

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your **CLUSTER\_NAME** variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see [Resolve errors for storage account names](#) in the Azure documentation.

2. Export the storage account key as an environment variable:

```
$ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query "[0].value" -o tsv`
```

3. Export the URL of the RHCOS VHD to an environment variable:

```
$ export VHD_URL=`openshift-install coreos print-stream-json | jq -r '.architectures.x86_64."rhel-coreos-extensions"."azure-disk".url`
```

#### IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Create the storage container for the VHD:

```
$ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
```

5. Copy the local VHD to a blob:

```
$ az storage blob copy start --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} --destination-blob "rhcos.vhd" --destination-container vhd --source-uri "${VHD_URL}"
```

6. Create a blob storage container and upload the generated **bootstrap.ign** file:

```
$ az storage container create --name files --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY}
```

```
$ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"
```

### 6.10.11. Example for creating DNS zones

DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, [Azure's DNS solution](#) is used, so you will create a new public DNS zone for external (internet) visibility and a private DNS zone for internal cluster resolution.

#### NOTE

The public DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the public DNS zone; be sure the installation config you generated earlier reflects that scenario.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

#### Procedure

1. Create the new public DNS zone in the resource group exported in the **BASE\_DOMAIN\_RESOURCE\_GROUP** environment variable:

```
$ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n ${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can skip this step if you are using a public DNS zone that already exists.

2. Create the private DNS zone in the same resource group as the rest of this deployment:

```
$ az network private-dns zone create -g ${RESOURCE_GROUP} -n
${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can learn more about [configuring a public DNS zone in Azure](#) by visiting that section.

## 6.10.12. Creating a VNet in Azure

You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

### NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

### Procedure

1. Copy the template from the **ARM template for the VNet** section of this topic and save it as **01\_vnet.json** in your cluster's installation directory. This template describes the VNet that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/01_vnet.json" \
--parameters baseName="${INFRA_ID}" 1
```

- 1** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Link the VNet template to the private DNS zone:

```
$ az network private-dns link vnet create -g ${RESOURCE_GROUP} -z
${CLUSTER_NAME}.${BASE_DOMAIN} -n ${INFRA_ID}-network-link -v "${INFRA_ID}-vnet"
-e false
```

### 6.10.12.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

#### Example 6.7. 01\_vnet.json ARM template

```
{
```

```

"$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
"contentVersion" : "1.0.0.0",
"parameters" : {
  "baseName" : {
    "type" : "string",
    "minLength" : 1,
    "metadata" : {
      "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
    }
  }
},
"variables" : {
  "location" : "[resourceGroup().location]",
  "virtualNetworkName" : "[concat(parameters('baseName'), '-vnet')]",
  "addressPrefix" : "10.0.0.0/16",
  "masterSubnetName" : "[concat(parameters('baseName'), '-master-subnet')]",
  "masterSubnetPrefix" : "10.0.0.0/24",
  "nodeSubnetName" : "[concat(parameters('baseName'), '-worker-subnet')]",
  "nodeSubnetPrefix" : "10.0.1.0/24",
  "clusterNsgName" : "[concat(parameters('baseName'), '-nsg')]"
},
"resources" : [
  {
    "apiVersion" : "2018-12-01",
    "type" : "Microsoft.Network/virtualNetworks",
    "name" : "[variables('virtualNetworkName')]",
    "location" : "[variables('location')]",
    "dependsOn" : [
      "[concat('Microsoft.Network/networkSecurityGroups/', variables('clusterNsgName'))]"
    ],
    "properties" : {
      "addressSpace" : {
        "addressPrefixes" : [
          "[variables('addressPrefix')]"
        ]
      },
      "subnets" : [
        {
          "name" : "[variables('masterSubnetName')]",
          "properties" : {
            "addressPrefix" : "[variables('masterSubnetPrefix')]",
            "serviceEndpoints": [],
            "networkSecurityGroup" : {
              "id" : "[resourceId('Microsoft.Network/networkSecurityGroups',
variables('clusterNsgName'))]"
            }
          }
        },
        {
          "name" : "[variables('nodeSubnetName')]",
          "properties" : {
            "addressPrefix" : "[variables('nodeSubnetPrefix')]",
            "serviceEndpoints": [],
            "networkSecurityGroup" : {
              "id" : "[resourceId('Microsoft.Network/networkSecurityGroups',

```

```

variables('clusterNsgName'))]"
    }
  }
}
]
}
},
{
  "type" : "Microsoft.Network/networkSecurityGroups",
  "name" : "[variables('clusterNsgName')]",
  "apiVersion" : "2018-10-01",
  "location" : "[variables('location')]",
  "properties" : {
    "securityRules" : [
      {
        "name" : "apiserver_in",
        "properties" : {
          "protocol" : "Tcp",
          "sourcePortRange" : "*",
          "destinationPortRange" : "6443",
          "sourceAddressPrefix" : "*",
          "destinationAddressPrefix" : "*",
          "access" : "Allow",
          "priority" : 101,
          "direction" : "Inbound"
        }
      }
    ]
  }
}
]
}
]
}
}

```

### 6.10.13. Deploying the RHCOS cluster image for the Azure infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure for your OpenShift Container Platform nodes.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

#### Procedure

1. Copy the template from the **ARM template for image storage** section of this topic and save it as **02\_storage.json** in your cluster's installation directory. This template describes the image storage that your cluster requires.

- Export the RHCOS VHD blob URL as a variable:

```
$ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --
account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
```

- Deploy the cluster image:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/02_storage.json" \
--parameters vhdBlobURL="${VHD_BLOB_URL}" \ 1 \
--parameters baseName="${INFRA_ID}" 2
```

- The blob URL of the RHCOS VHD to be used to create master and worker machines.
- The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 6.10.13.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

#### Example 6.8. 02\_storage.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/
deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the
cluster's Infra ID)"
      }
    },
    "vhdBlobURL" : {
      "type" : "string",
      "metadata" : {
        "description" : "URL pointing to the blob where the VHD to be used
to create master and worker machines is located"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "imageName" : "[concat(parameters('baseName'), '-image')]"
  },
  "resources" : [
    {
      "apiVersion" : "2018-06-01",
      "type" : "Microsoft.Compute/images",
      "name" : "[variables('imageName')]",
      "location" : "[variables('location')]",
      "properties" : {
```

```

"storageProfile": {
  "osDisk": {
    "osType": "Linux",
    "osState": "Generalized",
    "blobUri": "[parameters('vhdBlobURL')]",
    "storageAccountType": "Standard_LRS"
  }
}
}
}
]
}

```

## 6.10.14. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in **initramfs** during boot to fetch their Ignition config files.

### 6.10.14.1. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

#### IMPORTANT

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.38. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	<b>1936</b>	Metrics
	<b>9000-9999</b>	Host level services, including the node exporter on ports <b>9100-9101</b> and the Cluster Version Operator on port <b>9099</b> .
	<b>10250-10259</b>	The default ports that Kubernetes reserves
	<b>10256</b>	openshift-sdn
UDP	<b>4789</b>	VXLAN
	<b>6081</b>	Geneve

Protocol	Port	Description
	<b>9000-9999</b>	Host level services, including the node exporter on ports <b>9100-9101</b> .
	<b>500</b>	IPsec IKE packets
	<b>4500</b>	IPsec NAT-T packets
TCP/UDP	<b>30000-32767</b>	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 6.39. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	<b>6443</b>	Kubernetes API

Table 6.40. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	<b>2379-2380</b>	etcd server and peer ports

### 6.10.15. Creating networking and load balancing components in Azure

You must configure networking and load balancing in Microsoft Azure for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.

#### Procedure

1. Copy the template from the **ARM template for the network and load balancers** section of this topic and save it as **03\_infra.json** in your cluster's installation directory. This template describes the networking and load balancing objects that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/03_infra.json" \
  --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASE_DOMAIN}" 1 \
  --parameters baseName="${INFRA_ID}" 2
```

**1** The name of the private DNS zone.

**2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Create an **api** DNS record in the public zone for the API public load balancer. The **\${BASE\_DOMAIN\_RESOURCE\_GROUP}** variable must point to the resource group where the public DNS zone exists.

- a. Export the following variable:

```
$ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?
name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
```

- b. Create the **api** DNS record in a new public zone:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
```

If you are adding the cluster to an existing public zone, you can create the **api** DNS record in it instead:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
```

### 6.10.15.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

#### Example 6.9. 03\_infra.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-
01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
  }
}
```

```

},
"vnetBaseName": {
  "type": "string",
  "defaultValue": "",
  "metadata": {
    "description": "The specific customer vnet's base name (optional)"
  }
},
"privateDNSZoneName": {
  "type": "string",
  "metadata": {
    "description": "Name of the private DNS zone"
  }
}
},
"variables": {
  "location": "[resourceGroup().location]",
  "virtualNetworkName": "[concat(if(not(empty(parameters('vnetBaseName'))),
parameters('vnetBaseName'), parameters('baseName')), '-vnet')]",
  "virtualNetworkID": "[resourceId('Microsoft.Network/virtualNetworks',
variables('virtualNetworkName'))]",
  "masterSubnetName": "[concat(if(not(empty(parameters('vnetBaseName'))),
parameters('vnetBaseName'), parameters('baseName')), '-master-subnet')]",
  "masterSubnetRef": "[concat(variables('virtualNetworkID'), '/subnets/',
variables('masterSubnetName'))]",
  "masterPublicIpAddressName": "[concat(parameters('baseName'), '-master-pip')]",
  "masterPublicIpAddressID": "[resourceId('Microsoft.Network/publicIPAddresses',
variables('masterPublicIpAddressName'))]",
  "masterLoadBalancerName": "[concat(parameters('baseName'), '-public-lb')]",
  "masterLoadBalancerID": "[resourceId('Microsoft.Network/loadBalancers',
variables('masterLoadBalancerName'))]",
  "internalLoadBalancerName": "[concat(parameters('baseName'), '-internal-lb')]",
  "internalLoadBalancerID": "[resourceId('Microsoft.Network/loadBalancers',
variables('internalLoadBalancerName'))]",
  "skuName": "Standard"
},
"resources": [
{
  "apiVersion": "2018-12-01",
  "type": "Microsoft.Network/publicIPAddresses",
  "name": "[variables('masterPublicIpAddressName')]",
  "location": "[variables('location')]",
  "sku": {
    "name": "[variables('skuName')]"
  },
  "properties": {
    "publicIPAllocationMethod": "Static",
    "dnsSettings": {
      "domainNameLabel": "[variables('masterPublicIpAddressName')]"
    }
  }
},
{
  "apiVersion": "2018-12-01",
  "type": "Microsoft.Network/loadBalancers",
  "name": "[variables('masterLoadBalancerName')]",

```

```

"location" : "[variables('location')]",
"sku": {
  "name": "[variables('skuName')]"
},
"dependsOn" : [
  "[concat('Microsoft.Network/publicIPAddresses/', variables('masterPublicIpAddressName'))]"
],
"properties" : {
  "frontendIPConfigurations" : [
    {
      "name" : "public-lb-ip",
      "properties" : {
        "publicIPAddress" : {
          "id" : "[variables('masterPublicIpAddressID')]"
        }
      }
    }
  ],
  "backendAddressPools" : [
    {
      "name" : "public-lb-backend"
    }

      "aRecords": [
        {
          "ipv4Address": "[reference(variables('internalLoadBalancerName')).frontendIPConfigurations[0].properties.privateIP
Address]"
        }
      ]
    }
  }
]
}

```

### 6.10.16. Creating the bootstrap machine in Azure

You must create the bootstrap machine in Microsoft Azure to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.

- Create control plane and compute roles.

## Procedure

1. Copy the template from the **ARM template for the bootstrap machine** section of this topic and save it as **04\_bootstrap.json** in your cluster's installation directory. This template describes the bootstrap machine that your cluster requires.
2. Export the bootstrap URL variable:

```
$ bootstrap_url_expiry=`date -u -d "10 hours" '+%Y-%m-%dT%H:%MZ`
```

```
$ export BOOTSTRAP_URL=`az storage blob generate-sas -c 'files' -n 'bootstrap.ign' --https-only --full-uri --permissions r --expiry $bootstrap_url_expiry --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -o tsv`
```

3. Export the bootstrap ignition variable:

```
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d '\n`
```

4. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/04_bootstrap.json" \
  --parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \ 1
  --parameters baseName="${INFRA_ID}" 2
```

**1** The bootstrap Ignition content for the bootstrap cluster.

**2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 6.10.16.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

#### Example 6.10. 04\_bootstrap.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "vnetBaseName": {
```

```

    "type": "string",
    "defaultValue": "",
    "metadata": {
      "description": "The specific customer vnet's base name (optional)"
    }
  },
  "bootstrapIgnition": {
    "type": "string",
    "minLength": 1,
    "metadata": {
      "description": "Bootstrap ignition content for the bootstrap cluster"
    }
  },
  "sshKeyData": {
    "type": "securestring",
    "defaultValue": "Unused",
    "metadata": {
      "description": "Unused"
    }
  },
  "bootstrapVMSize": {
    "type": "string",
    "defaultValue": "Standard_D4s_v3",
    "metadata": {
      "description": "The size of the Bootstrap Virtual Machine"
    }
  }
},
"variables": {
  "location": "[resourceGroup().location]",
  "virtualNetworkName": "[concat(if(not(empty(parameters('vnetBaseName'))),
parameters('vnetBaseName'), parameters('baseName')), '-vnet')]",
  "virtualNetworkID": "[resourceId('Microsoft.Network/virtualNetworks',
variables('virtualNetworkName'))]",
  "masterSubnetName": "[concat(if(not(empty(parameters('vnetBaseName'))),
parameters('vnetBaseName'), parameters('baseName')), '-master-subnet')]",

### 6.10.17. Creating the control plane machines in Azure

You must create the control plane machines in Microsoft Azure for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

By default, Microsoft Azure places control plane machines and compute machines in a pre-set availability zone. You can manually set an availability zone for a compute node or control plane node. To do this, modify a vendor's Azure Resource Manager (ARM) template by specifying each of your availability zones in the **zones** parameter of the virtual machine resource.

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, consider contacting Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

#### Procedure

1. Copy the template from the **ARM template for control plane machines** section of this topic and save it as **05\_masters.json** in your cluster's installation directory. This template describes the control plane machines that your cluster requires.
2. Export the following variable needed by the control plane machine deployment:

```
$ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d "\n`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/05_masters.json" \
```

```
--parameters masterIgnition="${MASTER_IGNITION}" \ 1
--parameters baseName="${INFRA_ID}" 2
```

- 1** The Ignition content for the control plane nodes.
- 2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 6.10.17.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

#### Example 6.11. 05\_masters.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "vnetBaseName" : {
      "type" : "string",
      "defaultValue" : "",
      "metadata" : {
        "description" : "The specific customer vnet's base name (optional)"
      }
    },
    "masterIgnition" : {
      "type" : "string",
      "metadata" : {
        "description" : "Ignition content for the master nodes"
      }
    },
    "numberOfMasters" : {
      "type" : "int",
      "defaultValue" : 3,
      "minValue" : 2,
      "maxValue" : 30,
      "metadata" : {
        "description" : "Number of OpenShift masters to deploy"
      }
    },
    "sshKeyData" : {
      "type" : "securestring",
      "defaultValue" : "Unused",
      "metadata" : {
        "description" : "Unused"
      }
    }
  }
}
```

```

},
"privateDNSZoneName" : {
  "type" : "string",
  "defaultValue" : "",
  "metadata" : {
    "description" : "unused"
  }
},
"masterVMSize" : {
  "type" : "string",
  "defaultValue" : "Standard_D8s_v3",
  "metadata" : {
    "description" : "The size of the Master Virtual Machines"
  }
},
"diskSizeGB" : {
  "type" : "int",
  "defaultValue" : 1024,
  "metadata" : {
    "description" : "Size of the Master VM OS disk, in GB"
  }
},
"variables" : {
  "location" : "[resourceGroup().location]",
  "virtualNetworkName" : "[concat(if(not(empty(parameters('vnetBaseName'))),
parameters('vnetBaseName'), parameters('baseName')), '-vnet')]",
  "virtualNetworkID" : "[resourceId('Microsoft.Network/virtualNetworks',
variables('virtualNetworkName'))]",
  "masterSubnetName" : "[concat(if(not(empty(parameters('vnetBaseName'))),
parameters('vnetBaseName'), parameters('baseName')), '-master-subnet')]",
  "masterSubnetRef" : "[concat(variables('virtualNetworkID'), '/subnets/',
variables('masterSubnetName'))]",
  "masterLoadBalancerName" : "[concat(parameters('baseName'), '-public-lb')]",
  "internalLoadBalancerName" : "[concat(parameters('baseName'), '-internal-lb')]",
  "sshKeyPath" : "/home/core/.ssh/authorized_keys",
  "identityName" : "[concat(parameters('baseName'), '-identity')]",
  "imageName" : "[concat(parameters('baseName'), '-image')]",
  "copy" : [
    {
      "name" : "vmNames",
      "count" : "[parameters('numberOfMasters')]",
      "input" : "[concat(parameters('baseName'), '-master-', copyIndex('vmNames'))]"
    }
  ]
},
"resources" : [
{
  "apiVersion" : "2018-06-01",
  "type" : "Microsoft.Network/networkInterfaces",
  "copy" : {
    "name" : "nicCopy",
    "count" : "[length(variables('vmNames'))]"
  },
  "name" : "[concat(variables('vmNames')[copyIndex()], '-nic')]",
  "location" : "[variables('location')]",

```

```

"properties" : {
  "ipConfigurations" : [
    {
      "name" : "pipConfig",
      "properties" : {
        "privateIPAllocationMethod" : "Dynamic",
        "subnet" : {
          "id" : "[variables('masterSubnetRef')]"
        },
        "loadBalancerBackendAddressPools" : [
          {
            "id" : "[concat('/subscriptions/', subscription().subscriptionId, '/resourceGroups/',
resourceGroup().name, '/providers/Microsoft.Network/loadBalancers/',
variables('masterLoadBalancerName'), '/backendAddressPools/public-lb-backend')]"
          },
          {
            "id" : "[concat('/subscriptions/', subscription().subscriptionId, '/resourceGroups/',
resourceGroup().name, '/providers/Microsoft.Network/loadBalancers/',
variables('internalLoadBalancerName'), '/backendAddressPools/internal-lb-backend')]"
          }
        ]
      }
    }
  ]
},
{
  "apiVersion" : "2018-06-01",
  "type" : "Microsoft.Compute/virtualMachines",
  "copy" : {
    "name" : "vmCopy",
    "count" : "[length(variables('vmNames'))]"
  },
  "name" : "[variables('vmNames')[copyIndex()]]",
  "location" : "[variables('location')]",
  "identity" : {
    "type" : "userAssigned",
    "userAssignedIdentities" : {
      "[resourceID('Microsoft.ManagedIdentity/userAssignedIdentities/',
variables('identityName'))]" : {}
    }
  },
  "dependsOn" : [
    "[concat('Microsoft.Network/networkInterfaces/', concat(variables('vmNames')[copyIndex()], '-
nic'))]"
  ],
  "properties" : {
    "hardwareProfile" : {
      "vmSize" : "[parameters('masterVMSize')]"
    },
    "osProfile" : {
      "computerName" : "[variables('vmNames')[copyIndex()]]",
      "adminUsername" : "core",
      "adminPassword" : "NotActuallyApplied!",
      "customData" : "[parameters('masterIgnition')]",
      "linuxConfiguration" : {

```

```

        "disablePasswordAuthentication" : false
      }
    },
    "storageProfile" : {
      "imageReference": {
        "id": "[resourceId('Microsoft.Compute/images', variables('imageName'))]"
      },
      "osDisk" : {
        "name": "[concat(variables('vmNames')[copyIndex()], '_OSDisk')]",
        "osType" : "Linux",
        "createOption" : "FromImage",
        "caching": "ReadOnly",
        "writeAcceleratorEnabled": false,
        "managedDisk": {
          "storageAccountType": "Premium_LRS"
        },
        "diskSizeGB" : "[parameters('diskSizeGB')]"
      }
    },
    "networkProfile" : {
      "networkInterfaces" : [
        {
          "id" : "[resourceId('Microsoft.Network/networkInterfaces', concat(variables('vmNames')
[copyIndex()], '-nic'))]",
          "properties": {
            "primary": false
          }
        }
      ]
    }
  }
]
}

```

### 6.10.18. Wait for bootstrap completion and remove bootstrap resources in Azure

After you create all of the required infrastructure in Microsoft Azure, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

- Create the control plane machines.

## Procedure

1. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ ❶
--log-level info ❷
```

- ❶ For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- ❷ To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```
$ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --
name bootstrap_ssh_in
$ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
$ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap OSDisk --no-
wait --yes
$ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-
wait
$ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name
${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
$ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-
ssh-pip
```

### NOTE

If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

## 6.10.19. Creating additional worker machines in Azure

You can create worker machines in Microsoft Azure for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM) template. Additional instances can be launched by including additional resources of type **06\_workers.json** in the file.

**NOTE**

By default, Microsoft Azure places control plane machines and compute machines in a pre-set availability zone. You can manually set an availability zone for a compute node or control plane node. To do this, modify a vendor's ARM template by specifying each of your availability zones in the **zones** parameter of the virtual machine resource.

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, consider contacting Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Copy the template from the **ARM template for worker machines** section of this topic and save it as **06\_workers.json** in your cluster's installation directory. This template describes the worker machines that your cluster requires.
2. Export the following variable needed by the worker machine deployment:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d '\n'`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/06_workers.json" \
  --parameters workerIgnition="${WORKER_IGNITION}" \ 1
  --parameters baseName="${INFRA_ID}" 2
```

- 1** The Ignition content for the worker nodes.
- 2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

**6.10.19.1. ARM template for worker machines**

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

## Example 6.12. 06\_workers.json ARM template

```

{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "vnetBaseName": {
      "type": "string",
      "defaultValue": "",
      "metadata" : {
        "description" : "The specific customer vnet's base name (optional)"
      }
    },
    "workerIgnition" : {
      "type" : "string",
      "metadata" : {
        "description" : "Ignition content for the worker nodes"
      }
    },
    "numberOfNodes" : {
      "type" : "int",
      "defaultValue" : 3,
      "minValue" : 2,
      "maxValue" : 30,
      "metadata" : {
        "description" : "Number of OpenShift compute nodes to deploy"
      }
    },
    "sshKeyData" : {
      "type" : "securestring",

}
}

```

### 6.10.20. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.10. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.10 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.10 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.10.21. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

### Example output

```
system:admin
```

## 6.10.22. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

### Prerequisites

- You added machines to your cluster.

### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.23.0
master-1  Ready   master 63m  v1.23.0
master-2  Ready   master 64m  v1.23.0
```

The output lists all of the machines that you created.

### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

NAME	AGE	REQUESTOR	CONDITION
csr-8b2br	15m	system:serviceaccount:openshift-machine-config-operator:node-bootstrapper	Pending
csr-8vnps	15m	system:serviceaccount:openshift-machine-config-operator:node-bootstrapper	Pending
...			

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

#### NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

#### NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}\n{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

#### NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.23.0
master-1  Ready   master 73m  v1.23.0
master-2  Ready   master 74m  v1.23.0
worker-0  Ready   worker 11m  v1.23.0
worker-1  Ready   worker 11m  v1.23.0
```

### NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 6.10.23. Adding the Ingress DNS records

If you removed the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can create either a wildcard **\*.apps.{baseDomain}**, or specific records. You can use A, CNAME, and other records per your requirements.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster on Microsoft Azure by using infrastructure that you provisioned.
- Install the OpenShift CLI (**oc**).
- Install or update the [Azure CLI](#).

#### Procedure

1. Confirm the Ingress router has created a load balancer and populated the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

#### Example output

```
NAME          TYPE          CLUSTER-IP    EXTERNAL-IP    PORT(S)          AGE
router-default LoadBalancer  172.30.20.10  35.130.120.110 80:32288/TCP,443:31215/TCP 20
```

2. Export the Ingress router IP as a variable:

```
$ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

3. Add a **\*.apps** record to the public DNS zone.

- a. If you are adding this cluster to a new public zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300
```

- b. If you are adding this cluster to an already existing public zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300
```

4. Add a **\*.apps** record to the private DNS zone:

- a. Create a **\*.apps** record by using the following command:

```
$ az network private-dns record-set a create -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps --ttl 300
```

- b. Add the **\*.apps** record to the private DNS zone by using the following command:

■

```
$ az network private-dns record-set a add-record -g ${RESOURCE_GROUP} -z
${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER}
```

If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the cluster's current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}
{end}' routes
```

### Example output

```
oauth-openshift.apps.cluster.basedomain.com
console-openshift-console.apps.cluster.basedomain.com
downloads-openshift-console.apps.cluster.basedomain.com
alertmanager-main-openshift-monitoring.apps.cluster.basedomain.com
grafana-openshift-monitoring.apps.cluster.basedomain.com
prometheus-k8s-openshift-monitoring.apps.cluster.basedomain.com
```

## 6.10.24. Completing an Azure installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Microsoft Azure user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

### Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure infrastructure.
- Install the **oc** CLI and log in.

### Procedure

- Complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

### Example output

```
INFO Waiting up to 30m0s for the cluster to initialize...
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 6.10.25. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.10, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 6.11. UNINSTALLING A CLUSTER ON AZURE

You can remove a cluster that you deployed to Microsoft Azure.

### 6.11.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

## NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

#### Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

While you can uninstall the cluster using the copy of the installation program that was used to deploy it, using OpenShift Container Platform version 4.13 or later is recommended.

The removal of service principals is dependent on the Microsoft Azure AD Graph API. Using version 4.13 or later of the installation program ensures that service principals are removed without the need for manual intervention, if and when Microsoft decides to [retire](#) the Azure AD Graph API.

## Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$. /openshift-install destroy cluster \  
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

1. Optional: Delete the **<installation\_directory>** directory and the OpenShift Container Platform installation program.

## CHAPTER 7. INSTALLING ON AZURE STACK HUB

### 7.1. PREPARING TO INSTALL ON AZURE STACK HUB

#### 7.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You have installed Azure Stack Hub version 2008 or later.

#### 7.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub

Before installing OpenShift Container Platform on Microsoft Azure Stack Hub, you must configure an Azure account.

See [Configuring an Azure Stack Hub account](#) for details about account configuration, account limits, DNS zone configuration, required roles, and creating service principals.

#### 7.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 7.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure Stack Hub infrastructure that is provisioned by the OpenShift Container Platform installation program, by using the following method:

- [Installing a cluster on Azure Stack Hub with an installer-provisioned infrastructure](#) You can install OpenShift Container Platform on Azure Stack Hub infrastructure that is provisioned by the OpenShift Container Platform installation program.

##### 7.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure Stack Hub infrastructure that you provision, by using the following method:

- [Installing a cluster on Azure Stack Hub using ARM templates](#) You can install OpenShift Container Platform on Azure Stack Hub by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

#### 7.1.4. Next steps

- [Configuring an Azure Stack Hub account](#)

## 7.2. CONFIGURING AN AZURE STACK HUB ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 7.2.1. Azure Stack Hub account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure Stack Hub components, and the default [Quota types in Azure Stack Hub](#) affect your ability to install OpenShift Container Platform clusters.

The following table summarizes the Azure Stack Hub components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Description
vCPU	56	<p>A default cluster requires 56 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>• One bootstrap machine, which is removed after installation</li> <li>• Three control plane machines</li> <li>• Three compute machines</li> </ul> <p>Because the bootstrap, control plane, and worker machines use <b>Standard_DS4_v2</b> virtual machines, which use 8 vCPUs, a default cluster requires 56 vCPUs. The bootstrap node VM is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p>
VNet	1	Each default cluster requires one Virtual Network (VNet), which contains two subnets.
Network interfaces	7	Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.

Component	Number of components required by default	Description						
Network security groups	2	<p>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443		
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere							
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443							
Network load balancers	3	<p>Each cluster creates the following <a href="#">load balancers</a>:</p> <table border="1"> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines							
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines							
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines							
Public IP addresses	2	The public load balancer uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7	The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						

### Additional resources

- [Optimizing storage](#).

## 7.2.2. Configuring a DNS zone in Azure Stack Hub

To successfully install OpenShift Container Platform on Azure Stack Hub, you must create DNS records in an Azure Stack Hub DNS zone. The DNS zone must be authoritative for the domain. To delegate a registrar's DNS zone to Azure Stack Hub, see Microsoft's documentation for [Azure Stack Hub datacenter DNS integration](#).

### 7.2.3. Required Azure Stack Hub roles

Your Microsoft Azure Stack Hub account must have the following roles for the subscription that you use:

- **Owner**

To set roles on the Azure portal, see the [Manage access to resources in Azure Stack Hub with role-based access control](#) in the Microsoft documentation.

### 7.2.4. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

#### Prerequisites

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

#### Procedure

1. Register your environment:

```
$ az cloud register -n AzureStackCloud --endpoint-resource-manager <endpoint> 1
```

- 1 Specify the Azure Resource Manager endpoint, ``https://management.<region>.<fqdn>/``.

See the [Microsoft documentation](#) for details.

2. Set the active environment:

```
$ az cloud set -n AzureStackCloud
```

3. Update your environment configuration to use the specific API version for Azure Stack Hub:

```
$ az cloud update --profile 2019-03-01-hybrid
```

4. Log in to the Azure CLI:

```
$ az login
```

If you are in a multitenant environment, you must also supply the tenant ID.

5. If your Azure account uses subscriptions, ensure that you are using the right subscription:

- a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

#### Example output

```
[
  {
    "cloudName": AzureStackCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

### Example output

```
{
  "environmentName": AzureStackCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

- 1** Ensure that the value of the **tenantId** parameter is the correct subscription ID.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> 1
```

- 1** Specify the subscription ID.

- d. Verify the subscription ID update:

```
$ az account show
```

### Example output

```
{
  "environmentName": AzureStackCloud",
```

```

    "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
}

```

- Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.
- Create the service principal for your account:

```

$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ 1
--scopes /subscriptions/<subscription_id> 2
--years <years> 3

```

- Specify the service principal name.
- Specify the subscription ID.
- Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

### Example output

```

Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not
include these credentials in your code or check the credentials into your source
control. For more information, see https://aka.ms/azadsp-cli
{
  "appId": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}

```

- Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.

### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

### 7.2.5. Next steps

- Install an OpenShift Container Platform cluster:
  - [Installing a cluster quickly on Azure Stack Hub](#) .

- Install an OpenShift Container Platform cluster on Azure Stack Hub with user-provisioned infrastructure by following [Installing a cluster on Azure Stack Hub using ARM templates](#) .

## 7.3. INSTALLING A CLUSTER ON AZURE STACK HUB WITH AN INSTALLER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.10, you can install a cluster on Microsoft Azure Stack Hub with an installer-provisioned infrastructure. However, you must manually configure the **install-config.yaml** file to specify values that are specific to Azure Stack Hub.

### NOTE

While you can select **azure** when using the installation program to deploy a cluster using installer-provisioned infrastructure, this option is only supported for the Azure Public Cloud.

### 7.3.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure Stack Hub account](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- You verified that you have approximately 16 GB of local disk space. Installing the cluster requires that you download the RHCOS virtual hard disk (VHD) cluster image and upload it to your Azure Stack Hub environment so that it is accessible during deployment. Decompressing the VHD files requires this amount of local disk space.

### 7.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.10, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 7.3.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS validated or Modules In Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**7.3.4. Uploading the RHCOS cluster image**

You must download the RHCOS virtual hard disk (VHD) cluster image and upload it to your Azure Stack Hub environment so that it is accessible during deployment.

**Prerequisites**

- Configure an Azure account.

**Procedure**

1. Obtain the RHCOS VHD cluster image:

- a. Export the URL of the RHCOS VHD to an environment variable.

```
$ export COMPRESSED_VHD_URL=$(openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.artifacts.azurestack.formats."vhd.gz".disk.location')
```

- b. Download the compressed RHCOS VHD file locally.

```
$ curl -O -L ${COMPRESSED_VHD_URL}
```

2. Decompress the VHD file.

#### NOTE

The decompressed VHD file is approximately 16 GB, so be sure that your host system has 16 GB of free space available. The VHD file can be deleted once you have uploaded it.

3. Upload the local VHD to the Azure Stack Hub environment, making sure that the blob is publicly available. For example, you can upload the VHD to a blob using the **az** cli or the web portal.

### 7.3.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select **Azure** as the cloud provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 7.3.6. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure Stack Hub, you must manually create your installation configuration file.

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

Make the following modifications:

- a. Specify the required installation parameters.
- b. Update the **platform.azure** section to specify the parameters that are specific to Azure Stack Hub.

- c. Optional: Update one or more of the default configuration parameters to customize the installation.  
For more information about the parameters, see "Installation configuration parameters".
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 7.3.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide a customized **install-config.yaml** installation configuration file that describes the details for your environment.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

##### 7.3.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 7.1. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object

Parameter	Description	Values
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>alibabacloud, aws, baremetal, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform.&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 7.3.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 7.2. Network parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:   <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

### 7.3.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 7.3. Optional parameters**

Parameter	Description	Values
<b>additionalTrustBundle</b>	<p>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</p>	String

Parameter	Description	Values
<b>cgroupsV2</b>	Enables <a href="#">Linux control groups version 2</a> (cgroups v2) on specific nodes in your cluster. The OpenShift Container Platform process for enabling cgroups v2 disables all cgroup version 1 controllers and hierarchies. The OpenShift Container Platform cgroups version 2 feature is in Developer Preview and is not supported by Red Hat at this time.	<b>true</b>
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>

Parameter	Description	Values
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="486 1377 593 1697" style="background-color: black; width: 67px; height: 143px; margin-bottom: 10px;"></div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>alibabacloud, aws, azure, gcp, ibmcloud, openstack, ovirt, vsphere</b> , or <b>{}</b>

Parameter	Description	Values
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 898 595 1245" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;"> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> </div> <div data-bbox="485 1294 595 1641" style="border: 1px solid black; padding: 5px;"> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p> </div>	<b>Mint</b> , <b>Passthrough</b> , <b>Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 20px; height: 100px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see <a href="#">Installing the system in FIPS mode</a>. The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 20px; height: 50px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings

Parameter	Description	Values
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<p><b>Internal</b> or <b>External</b>. The default value is <b>External</b>.</p> <p>Setting this field to <b>Internal</b> is not supported on non-cloud platforms and IBM Cloud VPC.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>IMPORTANT</b></p> <p>If the value of the field is set to <b>Internal</b>, the cluster will become non-functional. For more information, refer to <a href="#">BZ#1953035</a>.</p> </div> </div>
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p> </div> </div>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 7.3.6.1.4. Additional Azure Stack Hub configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 7.4. Additional Azure Stack Hub parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> or <b>premium_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .

Parameter	Description	Values
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS.</b>
<b>platform.azure.armEndpoint</b>	The URL of the Azure Resource Manager endpoint that your Azure Stack Hub operator provides.	String
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster.</b>
<b>platform.azure.region</b>	The name of your Azure Stack Hub local region.	String
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster by using the installation program deletes this resource group.	String, for example <b>existing_resource_group.</b>
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting.</b> The default is <b>LoadBalancer.</b>
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints.	<b>AzureStackCloud</b>

Parameter	Description	Values
<b>clusterOSImage</b>	The URL of a storage blob in the Azure Stack environment that contains an RHCOS VHD.	String, for example, <code>https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-azurestack.x86_64.vhd</code>

### 7.3.6.2. Sample customized install-config.yaml file for Azure Stack Hub

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Manual
controlPlane: 2 3
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 4
        diskType: premium_LRS
      replicas: 3
compute: 5
- name: worker
  platform:
    azure:
      osDisk:
        diskSizeGB: 512 6
        diskType: premium_LRS
      replicas: 3
metadata:
  name: test-cluster 7 8
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  azure:
    armEndpoint: azurestack_arm_endpoint 9 10
    baseDomainResourceGroupName: resource_group 11 12
    region: azure_stack_local_region 13 14

```

```

resourceGroupName: existing_resource_group 15
outboundType: Loadbalancer
cloudName: AzureStackCloud 16
clusterOSImage: https://vhdsa.blob.example.example.com/vhd/rhcos-410.84.202112040202-0-
azurestack.x86_64.vhd 17 18
pullSecret: '{"auths": ...}' 19 20
fips: false 21
sshKey: ssh-ed25519 AAAA... 22
additionalTrustBundle: | 23
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----

```

1 7 9 11 13 16 17 19 Required.

2 5 If you do not provide these parameters and values, the installation program provides the default value.

3 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Although both sections currently define a single machine pool, it is possible that future versions of OpenShift Container Platform will support defining multiple compute pools during installation. Only one control plane pool is used.

4 6 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

8 The name of the cluster.

10 The Azure Resource Manager endpoint that your Azure Stack Hub operator provides.

12 The name of the resource group that contains the DNS zone for your base domain.

14 The name of your Azure Stack Hub local region.

15 The name of an existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

18 The URL of a storage blob in the Azure Stack environment that contains an RHCOS VHD.

20 The pull secret required to authenticate your cluster.

21 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

## IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). The use of FIPS validated or Modules In Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

22

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

## NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

23

If the Azure Stack Hub environment is using an internal Certificate Authority (CA), adding the CA certificate is required.

### 7.3.7. Manually manage cloud credentials

The Cloud Credential Operator (CCO) only supports your cloud provider in manual mode. As a result, you must specify the identity and access management (IAM) secrets for your cloud provider.

#### Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

#### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

3. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
  --credentials-requests \
  --cloud=azure
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample `CredentialsRequest` object

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
    ...

```

4. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample `CredentialsRequest` object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
    ...
  secretRef:
    name: <component-secret>
    namespace: <component-namespace>
  ...

```

### Sample `Secret` object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component-secret>
  namespace: <component-namespace>
data:
  azure_subscription_id: <base64_encoded_azure_subscription_id>
  azure_client_id: <base64_encoded_azure_client_id>
  azure_client_secret: <base64_encoded_azure_client_secret>
  azure_tenant_id: <base64_encoded_azure_tenant_id>

```

```
azure_resource_prefix: <base64_encoded_azure_resource_prefix>
azure_resourcegroup: <base64_encoded_azure_resourcegroup>
azure_region: <base64_encoded_azure_region>
```

### IMPORTANT

The release image includes **CredentialsRequest** objects for Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set. You can identify these objects by their use of the **release.openshift.io/feature-gate: TechPreviewNoUpgrade** annotation.

- If you are not using any of these features, do not create secrets for these objects. Creating secrets for Technology Preview features that you are not using can cause the installation to fail.
  - If you are using any of these features, you must create secrets for the corresponding objects.
- To find **CredentialsRequest** objects with the **TechPreviewNoUpgrade** annotation, run the following command:

```
$ grep "release.openshift.io/feature-gate" *
```

#### Example output

```
0000_30_capi-operator_00_credentials-request.yaml: release.openshift.io/feature-gate:
TechPreviewNoUpgrade
```

### IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

#### Additional resources

- [Updating cloud provider resources with manually maintained credentials](#)

### 7.3.8. Configuring the cluster to use an internal CA

If the Azure Stack Hub environment is using an internal Certificate Authority (CA), update the **cluster-proxy-01-config.yaml** file to configure the cluster to use the internal CA.

#### Prerequisites

- Create the **install-config.yaml** file and specify the certificate trust bundle in **.pem** format.
- Create the cluster manifests.

#### Procedure

1. From the directory in which the installation program creates files, go to the **manifests** directory.
2. Add **user-ca-bundle** to the **spec.trustedCA.name** field.

### Example `cluster-proxy-01-config.yaml` file

```
apiVersion: config.openshift.io/v1
kind: Proxy
metadata:
  creationTimestamp: null
  name: cluster
spec:
  trustedCA:
    name: user-ca-bundle
status: {}
```

- Optional: Back up the **manifests/ cluster-proxy-01-config.yaml** file. The installation program consumes the **manifests/** directory when you deploy the cluster.

### 7.3.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

## 7.3.10. Installing the OpenShift CLI by downloading the binary
