## Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.

## Table of Contents

<b>CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW</b> .....	<b>61</b>
1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW	61
1.1.1. Installation process	62
The installation process with installer-provisioned infrastructure	63
The installation process with user-provisioned infrastructure	64
Installation process details	64
1.1.2. Verifying node state after installation	65
Installation scope	67
1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS	67
<b>CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS</b> .....	<b>69</b>
2.1. SELECTING A CLUSTER INSTALLATION TYPE	69
2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?	69
2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?	69
2.1.3. Do you want to use existing components in your cluster?	70
2.1.4. Do you need extra security for your cluster?	71
2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION	71
2.3. PREPARING YOUR CLUSTER FOR WORKLOADS	71
2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS	72
<b>CHAPTER 3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION</b> .....	<b>75</b>
3.1. PREREQUISITES	75
3.2. ABOUT THE MIRROR REGISTRY	75
3.3. PREPARING YOUR MIRROR HOST	76
3.3.1. Installing the OpenShift CLI by downloading the binary	76
Installing the OpenShift CLI on Linux	76
Installing the OpenShift CLI on Windows	77
Installing the OpenShift CLI on macOS	77
3.4. CONFIGURING CREDENTIALS THAT ALLOW IMAGES TO BE MIRRORED	78
3.5. MIRROR REGISTRY FOR RED HAT OPENSIFT	80
3.5.1. Mirror registry for Red Hat OpenShift introduction	81
3.5.2. Mirroring on a local host with mirror registry for Red Hat OpenShift	81
3.5.3. Mirroring on a remote host with mirror registry for Red Hat OpenShift	82
3.6. UPGRADING THE MIRROR REGISTRY FOR RED HAT OPENSIFT	84
3.6.1. Uninstalling the mirror registry for Red Hat OpenShift	84
3.6.2. Mirror registry for Red Hat OpenShift flags	84
3.7. MIRRORING THE OPENSIFT CONTAINER PLATFORM IMAGE REPOSITORY	86
3.8. THE CLUSTER SAMPLES OPERATOR IN A DISCONNECTED ENVIRONMENT	89
3.8.1. Cluster Samples Operator assistance for mirroring	89
3.9. MIRRORING OPERATOR CATALOGS FOR USE WITH DISCONNECTED CLUSTERS	90
3.9.1. Prerequisites	90
3.9.2. Extracting and mirroring catalog contents	91
3.9.2.1. Mirroring catalog contents to registries on the same network	91
3.9.2.2. Mirroring catalog contents to airgapped registries	92
3.9.3. Generated manifests	95
3.9.4. Post-installation requirements	96
3.10. NEXT STEPS	96
3.11. ADDITIONAL RESOURCES	96
<b>CHAPTER 4. INSTALLING ON AWS</b> .....	<b>97</b>
4.1. PREPARING TO INSTALL ON AWS	97
4.1.1. Prerequisites	97

4.1.2. Requirements for installing OpenShift Container Platform on AWS	97
4.1.3. Choosing a method to install OpenShift Container Platform on AWS	97
4.1.3.1. Installing a cluster on installer-provisioned infrastructure	97
4.1.3.2. Installing a cluster on user-provisioned infrastructure	98
4.1.4. Next steps	98
4.2. CONFIGURING AN AWS ACCOUNT	98
4.2.1. Configuring Route 53	98
4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53	99
4.2.2. AWS account limits	100
4.2.3. Required AWS permissions for the IAM user	102
4.2.4. Creating an IAM user	110
4.2.5. IAM Policies and AWS authentication	111
4.2.5.1. Default permissions for IAM instance profiles	111
4.2.5.2. Specifying an existing IAM role	113
4.2.5.3. Using AWS IAM Analyzer to create policy templates	113
4.2.6. Supported AWS Marketplace regions	114
4.2.7. Supported AWS regions	115
4.2.7.1. AWS public regions	115
4.2.7.2. AWS GovCloud regions	115
4.2.7.3. AWS C2S Secret region	116
4.2.7.4. AWS China regions	116
4.2.8. Next steps	116
4.3. MANUALLY CREATING IAM FOR AWS	116
4.3.1. Alternatives to storing administrator-level secrets in the kube-system project	116
4.3.2. Manually create IAM	117
4.3.3. Upgrading clusters with manually maintained credentials	120
4.3.4. Mint mode	121
4.3.5. Mint mode with removal or rotation of the administrator-level credential	121
4.3.6. Next steps	122
4.4. INSTALLING A CLUSTER QUICKLY ON AWS	122
4.4.1. Prerequisites	122
4.4.2. Internet access for OpenShift Container Platform	123
4.4.3. Generating a key pair for cluster node SSH access	123
4.4.4. Obtaining the installation program	125
4.4.5. Deploying the cluster	126
4.4.6. Installing the OpenShift CLI by downloading the binary	128
Installing the OpenShift CLI on Linux	128
Installing the OpenShift CLI on Windows	129
Installing the OpenShift CLI on macOS	129
4.4.7. Logging in to the cluster by using the CLI	130
4.4.8. Logging in to the cluster by using the web console	130
4.4.9. Telemetry access for OpenShift Container Platform	131
4.4.10. Next steps	131
4.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS	132
4.5.1. Prerequisites	132
4.5.2. Internet access for OpenShift Container Platform	132
4.5.3. Generating a key pair for cluster node SSH access	133
4.5.4. Obtaining an AWS Marketplace image	134
4.5.5. Obtaining the installation program	135
4.5.6. Creating the installation configuration file	136
4.5.6.1. Installation configuration parameters	137
4.5.6.1.1. Required configuration parameters	138
4.5.6.1.2. Network configuration parameters	139

4.5.6.1.3. Optional configuration parameters	141
4.5.6.1.4. Optional AWS configuration parameters	146
4.5.6.2. Minimum resource requirements for cluster installation	149
4.5.6.3. Supported AWS machine types	150
4.5.6.4. Sample customized install-config.yaml file for AWS	153
4.5.6.5. Configuring the cluster-wide proxy during installation	156
4.5.7. Deploying the cluster	157
4.5.8. Installing the OpenShift CLI by downloading the binary	159
Installing the OpenShift CLI on Linux	159
Installing the OpenShift CLI on Windows	159
Installing the OpenShift CLI on macOS	160
4.5.9. Logging in to the cluster by using the CLI	160
4.5.10. Logging in to the cluster by using the web console	161
4.5.11. Telemetry access for OpenShift Container Platform	162
4.5.12. Next steps	162
4.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS	162
4.6.1. Prerequisites	162
4.6.2. Internet access for OpenShift Container Platform	163
4.6.3. Generating a key pair for cluster node SSH access	163
4.6.4. Obtaining the installation program	165
4.6.5. Network configuration phases	166
4.6.6. Creating the installation configuration file	166
4.6.6.1. Installation configuration parameters	168
4.6.6.1.1. Required configuration parameters	168
4.6.6.1.2. Network configuration parameters	169
4.6.6.1.3. Optional configuration parameters	171
4.6.6.1.4. Optional AWS configuration parameters	176
4.6.6.2. Minimum resource requirements for cluster installation	179
4.6.6.3. Supported AWS machine types	180
4.6.6.4. Sample customized install-config.yaml file for AWS	183
4.6.6.5. Configuring the cluster-wide proxy during installation	185
4.6.7. Cluster Network Operator configuration	187
4.6.7.1. Cluster Network Operator configuration object	187
defaultNetwork object configuration	188
Configuration for the OpenShift SDN CNI cluster network provider	189
Configuration for the OVN-Kubernetes CNI cluster network provider	190
kubeProxyConfig object configuration	192
4.6.8. Specifying advanced network configuration	193
4.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster	194
4.6.10. Configuring hybrid networking with OVN-Kubernetes	195
4.6.11. Deploying the cluster	197
4.6.12. Installing the OpenShift CLI by downloading the binary	199
Installing the OpenShift CLI on Linux	199
Installing the OpenShift CLI on Windows	199
Installing the OpenShift CLI on macOS	200
4.6.13. Logging in to the cluster by using the CLI	200
4.6.14. Logging in to the cluster by using the web console	201
4.6.15. Telemetry access for OpenShift Container Platform	202
4.6.16. Next steps	202
4.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK	202
4.7.1. Prerequisites	202
4.7.2. About installations in restricted networks	203
4.7.2.1. Additional limits	203

4.7.3. About using a custom VPC	204
4.7.3.1. Requirements for using your VPC	204
4.7.3.2. VPC validation	206
4.7.3.3. Division of permissions	207
4.7.3.4. Isolation between clusters	207
4.7.4. Internet access for OpenShift Container Platform	207
4.7.5. Generating a key pair for cluster node SSH access	208
4.7.6. Creating the installation configuration file	210
4.7.6.1. Installation configuration parameters	212
4.7.6.1.1. Required configuration parameters	212
4.7.6.1.2. Network configuration parameters	214
4.7.6.1.3. Optional configuration parameters	215
4.7.6.1.4. Optional AWS configuration parameters	220
4.7.6.2. Minimum resource requirements for cluster installation	223
4.7.6.3. Sample customized install-config.yaml file for AWS	224
4.7.6.4. Configuring the cluster-wide proxy during installation	227
4.7.7. Deploying the cluster	228
4.7.8. Installing the OpenShift CLI by downloading the binary	230
Installing the OpenShift CLI on Linux	230
Installing the OpenShift CLI on Windows	231
Installing the OpenShift CLI on macOS	231
4.7.9. Logging in to the cluster by using the CLI	232
4.7.10. Disabling the default OperatorHub sources	232
4.7.11. Telemetry access for OpenShift Container Platform	233
4.7.12. Next steps	233
4.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC	233
4.8.1. Prerequisites	233
4.8.2. About using a custom VPC	234
4.8.2.1. Requirements for using your VPC	234
4.8.2.2. VPC validation	237
4.8.2.3. Division of permissions	237
4.8.2.4. Isolation between clusters	238
4.8.3. Internet access for OpenShift Container Platform	238
4.8.4. Generating a key pair for cluster node SSH access	238
4.8.5. Obtaining the installation program	240
4.8.6. Creating the installation configuration file	241
4.8.6.1. Installation configuration parameters	242
4.8.6.1.1. Required configuration parameters	242
4.8.6.1.2. Network configuration parameters	244
4.8.6.1.3. Optional configuration parameters	245
4.8.6.1.4. Optional AWS configuration parameters	250
4.8.6.2. Minimum resource requirements for cluster installation	253
4.8.6.3. Supported AWS machine types	254
4.8.6.4. Sample customized install-config.yaml file for AWS	257
4.8.6.5. Configuring the cluster-wide proxy during installation	260
4.8.7. Deploying the cluster	261
4.8.8. Installing the OpenShift CLI by downloading the binary	263
Installing the OpenShift CLI on Linux	263
Installing the OpenShift CLI on Windows	263
Installing the OpenShift CLI on macOS	264
4.8.9. Logging in to the cluster by using the CLI	264
4.8.10. Logging in to the cluster by using the web console	265
4.8.11. Telemetry access for OpenShift Container Platform	266

4.8.12. Next steps	266
4.9. INSTALLING A PRIVATE CLUSTER ON AWS	266
4.9.1. Prerequisites	266
4.9.2. Private clusters	267
4.9.2.1. Private clusters in AWS	267
4.9.2.1.1. Limitations	268
4.9.3. About using a custom VPC	268
4.9.3.1. Requirements for using your VPC	268
4.9.3.2. VPC validation	271
4.9.3.3. Division of permissions	271
4.9.3.4. Isolation between clusters	271
4.9.4. Internet access for OpenShift Container Platform	272
4.9.5. Generating a key pair for cluster node SSH access	272
4.9.6. Obtaining the installation program	274
4.9.7. Manually creating the installation configuration file	275
4.9.7.1. Installation configuration parameters	276
4.9.7.1.1. Required configuration parameters	276
4.9.7.1.2. Network configuration parameters	277
4.9.7.1.3. Optional configuration parameters	279
4.9.7.1.4. Optional AWS configuration parameters	284
4.9.7.2. Minimum resource requirements for cluster installation	287
4.9.7.3. Supported AWS machine types	288
4.9.7.4. Sample customized install-config.yaml file for AWS	291
4.9.7.5. Configuring the cluster-wide proxy during installation	294
4.9.8. Deploying the cluster	295
4.9.9. Installing the OpenShift CLI by downloading the binary	297
Installing the OpenShift CLI on Linux	297
Installing the OpenShift CLI on Windows	297
Installing the OpenShift CLI on macOS	298
4.9.10. Logging in to the cluster by using the CLI	298
4.9.11. Logging in to the cluster by using the web console	299
4.9.12. Telemetry access for OpenShift Container Platform	300
4.9.13. Next steps	300
4.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT OR SECRET REGION	300
4.10.1. Prerequisites	300
4.10.2. AWS government and secret regions	301
4.10.3. Installation requirements	301
4.10.4. Private clusters	302
4.10.4.1. Private clusters in AWS	302
4.10.4.1.1. Limitations	303
4.10.5. About using a custom VPC	303
4.10.5.1. Requirements for using your VPC	303
4.10.5.2. VPC validation	306
4.10.5.3. Division of permissions	306
4.10.5.4. Isolation between clusters	307
4.10.6. Internet access for OpenShift Container Platform	307
4.10.7. Generating a key pair for cluster node SSH access	307
4.10.8. Uploading a custom RHCOS AMI in AWS	309
4.10.9. Obtaining an AWS Marketplace image	311
4.10.10. Obtaining the installation program	312
4.10.11. Manually creating the installation configuration file	313
4.10.11.1. Installation configuration parameters	314
4.10.11.1.1. Required configuration parameters	314

4.10.11.1.2. Network configuration parameters	316
4.10.11.1.3. Optional configuration parameters	318
4.10.11.1.4. Optional AWS configuration parameters	322
4.10.11.2. Minimum resource requirements for cluster installation	325
4.10.11.3. Supported AWS machine types	326
4.10.11.4. Sample customized install-config.yaml file for AWS	329
4.10.11.5. Configuring the cluster-wide proxy during installation	332
4.10.12. Deploying the cluster	333
4.10.13. Installing the OpenShift CLI by downloading the binary	335
Installing the OpenShift CLI on Linux	335
Installing the OpenShift CLI on Windows	336
Installing the OpenShift CLI on macOS	336
4.10.14. Logging in to the cluster by using the CLI	337
4.10.15. Logging in to the cluster by using the web console	337
4.10.16. Telemetry access for OpenShift Container Platform	338
4.10.17. Next steps	338
4.11. INSTALLING A CLUSTER ON AWS CHINA	338
4.11.1. Prerequisites	339
4.11.2. Installation requirements	339
4.11.3. Internet access for OpenShift Container Platform	339
4.11.4. Private clusters	340
4.11.4.1. Private clusters in AWS	341
4.11.4.1.1. Limitations	341
4.11.5. About using a custom VPC	341
4.11.5.1. Requirements for using your VPC	341
4.11.5.2. VPC validation	344
4.11.5.3. Division of permissions	344
4.11.5.4. Isolation between clusters	345
4.11.6. Generating a key pair for cluster node SSH access	345
4.11.7. Uploading a custom RHCOS AMI in AWS	347
4.11.8. Obtaining the installation program	349
4.11.9. Manually creating the installation configuration file	350
4.11.9.1. Installation configuration parameters	351
4.11.9.1.1. Required configuration parameters	351
4.11.9.1.2. Network configuration parameters	352
4.11.9.1.3. Optional configuration parameters	354
4.11.9.2. Sample customized install-config.yaml file for AWS	359
4.11.9.3. Minimum resource requirements for cluster installation	361
4.11.9.4. Supported AWS machine types	362
4.11.9.5. Configuring the cluster-wide proxy during installation	365
4.11.10. Deploying the cluster	367
4.11.11. Installing the OpenShift CLI by downloading the binary	369
Installing the OpenShift CLI on Linux	369
Installing the OpenShift CLI on Windows	369
Installing the OpenShift CLI on macOS	370
4.11.12. Logging in to the cluster by using the CLI	370
4.11.13. Logging in to the cluster by using the web console	371
4.11.14. Telemetry access for OpenShift Container Platform	371
4.11.15. Next steps	372
4.12. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES	372
4.12.1. Prerequisites	372
4.12.2. Internet access for OpenShift Container Platform	373

4.12.3. Requirements for a cluster with user-provisioned infrastructure	373
4.12.3.1. Required machines for cluster installation	373
4.12.3.2. Minimum resource requirements for cluster installation	374
4.12.3.3. Certificate signing requests management	375
4.12.3.4. Supported AWS machine types	375
4.12.4. Required AWS infrastructure components	378
4.12.4.1. Other infrastructure components	379
4.12.4.2. Cluster machines	386
4.12.4.3. Required AWS permissions for the IAM user	386
4.12.5. Obtaining an AWS Marketplace image	394
4.12.6. Obtaining the installation program	395
4.12.7. Generating a key pair for cluster node SSH access	396
4.12.8. Creating the installation files for AWS	397
4.12.8.1. Optional: Creating a separate /var partition	398
4.12.8.2. Creating the installation configuration file	400
4.12.8.3. Configuring the cluster-wide proxy during installation	402
4.12.8.4. Creating the Kubernetes manifest and Ignition config files	403
4.12.9. Extracting the infrastructure name	405
4.12.10. Creating a VPC in AWS	406
4.12.10.1. CloudFormation template for the VPC	408
4.12.11. Creating networking and load balancing components in AWS	413
4.12.11.1. CloudFormation template for the network and load balancers	417
4.12.12. Creating security group and roles in AWS	425
4.12.12.1. CloudFormation template for security objects	427
4.12.13. Accessing RHCOS AMIs with stream metadata	438
4.12.14. RHCOS AMIs for the AWS infrastructure	439
4.12.14.1. AWS regions without a published RHCOS AMI	440
4.12.14.2. Uploading a custom RHCOS AMI in AWS	441
4.12.15. Creating the bootstrap node in AWS	443
4.12.15.1. CloudFormation template for the bootstrap machine	447
4.12.16. Creating the control plane machines in AWS	452
4.12.16.1. CloudFormation template for control plane machines	458
4.12.17. Creating the worker nodes in AWS	465
4.12.17.1. CloudFormation template for worker machines	470
4.12.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	473
4.12.19. Installing the OpenShift CLI by downloading the binary	474
Installing the OpenShift CLI on Linux	474
Installing the OpenShift CLI on Windows	474
Installing the OpenShift CLI on macOS	475
4.12.20. Logging in to the cluster by using the CLI	475
4.12.21. Approving the certificate signing requests for your machines	476
4.12.22. Initial Operator configuration	479
4.12.22.1. Image registry storage configuration	480
4.12.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure	480
4.12.22.1.2. Configuring storage for the image registry in non-production clusters	481
4.12.23. Deleting the bootstrap resources	481
4.12.24. Creating the Ingress DNS Records	482
4.12.25. Completing an AWS installation on user-provisioned infrastructure	484
4.12.26. Logging in to the cluster by using the web console	485
4.12.27. Telemetry access for OpenShift Container Platform	486
4.12.28. Additional resources	487
4.12.29. Next steps	487
4.13. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED	

INFRASTRUCTURE	487
4.13.1. Prerequisites	487
4.13.2. About installations in restricted networks	488
4.13.2.1. Additional limits	489
4.13.3. Internet access for OpenShift Container Platform	489
4.13.4. Requirements for a cluster with user-provisioned infrastructure	489
4.13.4.1. Required machines for cluster installation	489
4.13.4.2. Minimum resource requirements for cluster installation	490
4.13.4.3. Certificate signing requests management	491
4.13.4.4. Supported AWS machine types	491
4.13.5. Required AWS infrastructure components	494
4.13.5.1. Other infrastructure components	495
4.13.5.2. Cluster machines	502
4.13.5.3. Required AWS permissions for the IAM user	502
4.13.6. Generating a key pair for cluster node SSH access	510
4.13.7. Creating the installation files for AWS	512
4.13.7.1. Optional: Creating a separate /var partition	512
4.13.7.2. Creating the installation configuration file	515
4.13.7.3. Configuring the cluster-wide proxy during installation	517
4.13.7.4. Creating the Kubernetes manifest and Ignition config files	519
4.13.8. Extracting the infrastructure name	521
4.13.9. Creating a VPC in AWS	521
4.13.9.1. CloudFormation template for the VPC	523
4.13.10. Creating networking and load balancing components in AWS	529
4.13.10.1. CloudFormation template for the network and load balancers	532
4.13.11. Creating security group and roles in AWS	540
4.13.11.1. CloudFormation template for security objects	542
4.13.12. Accessing RHCOS AMIs with stream metadata	553
4.13.13. RHCOS AMIs for the AWS infrastructure	554
4.13.14. Creating the bootstrap node in AWS	555
4.13.14.1. CloudFormation template for the bootstrap machine	560
4.13.15. Creating the control plane machines in AWS	564
4.13.15.1. CloudFormation template for control plane machines	570
4.13.16. Creating the worker nodes in AWS	577
4.13.16.1. CloudFormation template for worker machines	583
4.13.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	585
4.13.18. Logging in to the cluster by using the CLI	586
4.13.19. Approving the certificate signing requests for your machines	587
4.13.20. Initial Operator configuration	589
4.13.20.1. Disabling the default OperatorHub sources	590
4.13.20.2. Image registry storage configuration	591
4.13.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure	591
4.13.20.2.2. Configuring storage for the image registry in non-production clusters	592
4.13.21. Deleting the bootstrap resources	592
4.13.22. Creating the Ingress DNS Records	593
4.13.23. Completing an AWS installation on user-provisioned infrastructure	596
4.13.24. Logging in to the cluster by using the web console	597
4.13.25. Telemetry access for OpenShift Container Platform	598
4.13.26. Additional resources	598
4.13.27. Next steps	598
4.14. UNINSTALLING A CLUSTER ON AWS	598
4.14.1. Removing a cluster that uses installer-provisioned infrastructure	598
4.14.2. Deleting AWS resources with the Cloud Credential Operator utility	599

<b>CHAPTER 5. INSTALLING ON AZURE</b> .....	<b>601</b>
5.1. PREPARING TO INSTALL ON AZURE	601
5.1.1. Prerequisites	601
5.1.2. Requirements for installing OpenShift Container Platform on Azure	601
5.1.3. Choosing a method to install OpenShift Container Platform on Azure	601
5.1.3.1. Installing a cluster on installer-provisioned infrastructure	601
5.1.3.2. Installing a cluster on user-provisioned infrastructure	602
5.1.4. Next steps	602
5.2. CONFIGURING AN AZURE ACCOUNT	602
5.2.1. Azure account limits	602
5.2.2. Configuring a public DNS zone in Azure	605
5.2.3. Increasing Azure account limits	606
5.2.4. Required Azure roles	606
5.2.5. Creating a service principal	607
5.2.6. Supported Azure Marketplace regions	609
5.2.7. Supported Azure regions	610
Supported Azure public regions	610
Supported Azure Government regions	611
5.2.8. Next steps	611
5.3. MANUALLY CREATING IAM FOR AZURE	611
5.3.1. Alternatives to storing administrator-level secrets in the kube-system project	611
5.3.2. Manually create IAM	612
5.3.3. Upgrading clusters with manually maintained credentials	614
5.3.4. Next steps	615
5.4. INSTALLING A CLUSTER QUICKLY ON AZURE	615
5.4.1. Prerequisites	615
5.4.2. Internet access for OpenShift Container Platform	616
5.4.3. Generating a key pair for cluster node SSH access	616
5.4.4. Obtaining the installation program	618
5.4.5. Deploying the cluster	619
5.4.6. Installing the OpenShift CLI by downloading the binary	621
Installing the OpenShift CLI on Linux	621
Installing the OpenShift CLI on Windows	622
Installing the OpenShift CLI on macOS	622
5.4.7. Logging in to the cluster by using the CLI	623
5.4.8. Telemetry access for OpenShift Container Platform	623
5.4.9. Next steps	624
5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS	624
5.5.1. Prerequisites	624
5.5.2. Internet access for OpenShift Container Platform	624
5.5.3. Generating a key pair for cluster node SSH access	624
5.5.4. Selecting an Azure Marketplace image	626
5.5.5. Obtaining the installation program	628
5.5.6. Creating the installation configuration file	629
5.5.6.1. Installation configuration parameters	630
5.5.6.1.1. Required configuration parameters	631
5.5.6.1.2. Network configuration parameters	632
5.5.6.1.3. Optional configuration parameters	634
5.5.6.1.4. Additional Azure configuration parameters	639
5.5.6.2. Minimum resource requirements for cluster installation	641
5.5.6.3. Sample customized install-config.yaml file for Azure	642
5.5.6.4. Configuring the cluster-wide proxy during installation	644
5.5.7. Updating manifests for Marketplace installation	645

5.5.8. Deploying the cluster	646
5.5.9. Installing the OpenShift CLI by downloading the binary	647
Installing the OpenShift CLI on Linux	647
Installing the OpenShift CLI on Windows	648
Installing the OpenShift CLI on macOS	648
5.5.10. Logging in to the cluster by using the CLI	649
5.5.11. Telemetry access for OpenShift Container Platform	650
5.5.12. Next steps	650
5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS	650
5.6.1. Prerequisites	650
5.6.2. Internet access for OpenShift Container Platform	650
5.6.3. Generating a key pair for cluster node SSH access	651
5.6.4. Obtaining the installation program	653
5.6.5. Creating the installation configuration file	653
5.6.5.1. Installation configuration parameters	655
5.6.5.1.1. Required configuration parameters	655
5.6.5.1.2. Network configuration parameters	657
5.6.5.1.3. Optional configuration parameters	659
5.6.5.1.4. Additional Azure configuration parameters	663
5.6.5.2. Minimum resource requirements for cluster installation	665
5.6.5.3. Sample customized install-config.yaml file for Azure	666
5.6.5.4. Configuring the cluster-wide proxy during installation	668
5.6.6. Network configuration phases	669
5.6.7. Specifying advanced network configuration	670
5.6.8. Cluster Network Operator configuration	671
5.6.8.1. Cluster Network Operator configuration object	671
defaultNetwork object configuration	672
Configuration for the OpenShift SDN CNI cluster network provider	673
Configuration for the OVN-Kubernetes CNI cluster network provider	674
kubeProxyConfig object configuration	676
5.6.9. Configuring hybrid networking with OVN-Kubernetes	677
5.6.10. Deploying the cluster	678
5.6.11. Installing the OpenShift CLI by downloading the binary	680
Installing the OpenShift CLI on Linux	680
Installing the OpenShift CLI on Windows	681
Installing the OpenShift CLI on macOS	681
5.6.12. Logging in to the cluster by using the CLI	681
5.6.13. Telemetry access for OpenShift Container Platform	682
5.6.14. Next steps	682
5.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET	682
5.7.1. Prerequisites	683
5.7.2. About reusing a VNet for your OpenShift Container Platform cluster	683
5.7.2.1. Requirements for using your VNet	683
5.7.2.1.1. Network security group requirements	684
5.7.2.2. Division of permissions	685
5.7.2.3. Isolation between clusters	685
5.7.3. Internet access for OpenShift Container Platform	685
5.7.4. Generating a key pair for cluster node SSH access	686
5.7.5. Obtaining the installation program	688
5.7.6. Creating the installation configuration file	688
5.7.6.1. Installation configuration parameters	690
5.7.6.1.1. Required configuration parameters	690
5.7.6.1.2. Network configuration parameters	692

5.7.6.1.3. Optional configuration parameters	694
5.7.6.1.4. Additional Azure configuration parameters	698
5.7.6.2. Minimum resource requirements for cluster installation	700
5.7.6.3. Sample customized install-config.yaml file for Azure	701
5.7.6.4. Configuring the cluster-wide proxy during installation	703
5.7.7. Deploying the cluster	704
5.7.8. Installing the OpenShift CLI by downloading the binary	706
Installing the OpenShift CLI on Linux	706
Installing the OpenShift CLI on Windows	707
Installing the OpenShift CLI on macOS	707
5.7.9. Logging in to the cluster by using the CLI	707
5.7.10. Telemetry access for OpenShift Container Platform	708
5.7.11. Next steps	708
5.8. INSTALLING A PRIVATE CLUSTER ON AZURE	708
5.8.1. Prerequisites	709
5.8.2. Private clusters	709
5.8.2.1. Private clusters in Azure	710
5.8.2.1.1. Limitations	710
5.8.2.2. User-defined outbound routing	710
Private cluster with network address translation	711
Private cluster with Azure Firewall	711
Private cluster with a proxy configuration	711
Private cluster with no internet access	711
5.8.3. About reusing a VNet for your OpenShift Container Platform cluster	711
5.8.3.1. Requirements for using your VNet	712
5.8.3.1.1. Network security group requirements	713
5.8.3.2. Division of permissions	713
5.8.3.3. Isolation between clusters	714
5.8.4. Internet access for OpenShift Container Platform	714
5.8.5. Generating a key pair for cluster node SSH access	714
5.8.6. Obtaining the installation program	716
5.8.7. Manually creating the installation configuration file	717
5.8.7.1. Installation configuration parameters	718
5.8.7.1.1. Required configuration parameters	718
5.8.7.1.2. Network configuration parameters	720
5.8.7.1.3. Optional configuration parameters	721
5.8.7.1.4. Additional Azure configuration parameters	726
5.8.7.2. Minimum resource requirements for cluster installation	728
5.8.7.3. Sample customized install-config.yaml file for Azure	729
5.8.7.4. Configuring the cluster-wide proxy during installation	731
5.8.8. Deploying the cluster	732
5.8.9. Installing the OpenShift CLI by downloading the binary	734
Installing the OpenShift CLI on Linux	734
Installing the OpenShift CLI on Windows	735
Installing the OpenShift CLI on macOS	735
5.8.10. Logging in to the cluster by using the CLI	735
5.8.11. Telemetry access for OpenShift Container Platform	736
5.8.12. Next steps	736
5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION	737
5.9.1. Prerequisites	737
5.9.2. Azure government regions	737
5.9.3. Private clusters	737
5.9.3.1. Private clusters in Azure	738

5.9.3.1.1. Limitations	738
5.9.3.2. User-defined outbound routing	739
Private cluster with network address translation	739
Private cluster with Azure Firewall	739
Private cluster with a proxy configuration	739
Private cluster with no internet access	740
5.9.4. About reusing a VNet for your OpenShift Container Platform cluster	740
5.9.4.1. Requirements for using your VNet	740
5.9.4.1.1. Network security group requirements	741
5.9.4.2. Division of permissions	742
5.9.4.3. Isolation between clusters	742
5.9.5. Internet access for OpenShift Container Platform	742
5.9.6. Generating a key pair for cluster node SSH access	743
5.9.7. Obtaining the installation program	744
5.9.8. Manually creating the installation configuration file	745
5.9.8.1. Installation configuration parameters	746
5.9.8.1.1. Required configuration parameters	746
5.9.8.1.2. Network configuration parameters	748
5.9.8.1.3. Optional configuration parameters	750
5.9.8.1.4. Additional Azure configuration parameters	754
5.9.8.2. Minimum resource requirements for cluster installation	756
5.9.8.3. Sample customized install-config.yaml file for Azure	757
5.9.8.4. Configuring the cluster-wide proxy during installation	759
5.9.9. Deploying the cluster	761
5.9.10. Installing the OpenShift CLI by downloading the binary	762
Installing the OpenShift CLI on Linux	762
Installing the OpenShift CLI on Windows	763
Installing the OpenShift CLI on macOS	763
5.9.11. Logging in to the cluster by using the CLI	764
5.9.12. Telemetry access for OpenShift Container Platform	764
5.9.13. Next steps	765
5.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES	765
5.10.1. Prerequisites	765
5.10.2. Internet access for OpenShift Container Platform	765
5.10.3. Configuring your Azure project	766
5.10.3.1. Azure account limits	766
5.10.3.2. Configuring a public DNS zone in Azure	769
5.10.3.3. Increasing Azure account limits	770
5.10.3.4. Certificate signing requests management	771
5.10.3.5. Required Azure roles	771
5.10.3.6. Creating a service principal	771
5.10.3.7. Supported Azure regions	773
Supported Azure public regions	774
Supported Azure Government regions	775
5.10.4. Requirements for a cluster with user-provisioned infrastructure	775
5.10.4.1. Required machines for cluster installation	775
5.10.4.2. Minimum resource requirements for cluster installation	776
5.10.5. Selecting an Azure Marketplace image	776
5.10.6. Obtaining the installation program	778
5.10.7. Generating a key pair for cluster node SSH access	779
5.10.8. Creating the installation files for Azure	781
5.10.8.1. Optional: Creating a separate /var partition	781
5.10.8.2. Creating the installation configuration file	783

5.10.8.3. Configuring the cluster-wide proxy during installation	785
5.10.8.4. Exporting common variables for ARM templates	787
5.10.8.5. Creating the Kubernetes manifest and Ignition config files	788
5.10.9. Creating the Azure resource group	790
5.10.10. Uploading the RHCOS cluster image and bootstrap Ignition config file	791
5.10.11. Example for creating DNS zones	792
5.10.12. Creating a VNet in Azure	793
5.10.12.1. ARM template for the VNet	794
5.10.13. Deploying the RHCOS cluster image for the Azure infrastructure	795
5.10.13.1. ARM template for image storage	796
5.10.14. Networking requirements for user-provisioned infrastructure	797
5.10.14.1. Network connectivity requirements	797
5.10.15. Creating networking and load balancing components in Azure	798
5.10.15.1. ARM template for the network and load balancers	799
5.10.16. Creating the bootstrap machine in Azure	804
5.10.16.1. ARM template for the bootstrap machine	805
5.10.17. Creating the control plane machines in Azure	810
5.10.17.1. ARM template for control plane machines	811
5.10.18. Wait for bootstrap completion and remove bootstrap resources in Azure	816
5.10.19. Creating additional worker machines in Azure	817
5.10.19.1. ARM template for worker machines	819
5.10.20. Installing the OpenShift CLI by downloading the binary	823
Installing the OpenShift CLI on Linux	823
Installing the OpenShift CLI on Windows	824
Installing the OpenShift CLI on macOS	824
5.10.21. Logging in to the cluster by using the CLI	824
5.10.22. Approving the certificate signing requests for your machines	825
5.10.23. Adding the Ingress DNS records	828
5.10.24. Completing an Azure installation on user-provisioned infrastructure	829
5.10.25. Telemetry access for OpenShift Container Platform	830
5.11. UNINSTALLING A CLUSTER ON AZURE	830
5.11.1. Removing a cluster that uses installer-provisioned infrastructure	830
<b>CHAPTER 6. INSTALLING ON AZURE STACK HUB .....</b>	<b>832</b>
6.1. PREPARING TO INSTALL ON AZURE STACK HUB	832
6.1.1. Prerequisites	832
6.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub	832
6.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub	832
6.1.3.1. Installing a cluster on user-provisioned infrastructure	832
6.1.4. Next steps	832
6.2. CONFIGURING AN AZURE STACK HUB ACCOUNT	832
6.2.1. Azure Stack Hub account limits	833
6.2.2. Configuring a DNS zone in Azure Stack Hub	834
6.2.3. Required Azure Stack Hub roles	835
6.2.4. Creating a service principal	835
6.2.5. Next steps	837
6.3. MANUALLY CREATING IAM FOR AZURE STACK HUB	838
6.3.1. Alternatives to storing administrator-level secrets in the kube-system project	838
6.3.2. Manually create IAM	838
6.3.3. Upgrading clusters with manually maintained credentials	840
6.3.4. Next steps	841
6.4. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES	841
6.4.1. Prerequisites	842

6.4.2. Internet access for OpenShift Container Platform	842
6.4.3. Configuring your Azure Stack Hub project	843
6.4.3.1. Azure Stack Hub account limits	843
6.4.3.2. Configuring a DNS zone in Azure Stack Hub	845
6.4.3.3. Certificate signing requests management	845
6.4.3.4. Required Azure Stack Hub roles	845
6.4.3.5. Creating a service principal	845
6.4.4. Obtaining the installation program	848
6.4.5. Generating a key pair for cluster node SSH access	849
6.4.6. Creating the installation files for Azure Stack Hub	851
6.4.6.1. Manually creating the installation configuration file	851
6.4.6.2. Sample customized install-config.yaml file for Azure Stack Hub	852
6.4.6.3. Configuring the cluster-wide proxy during installation	854
6.4.6.4. Exporting common variables for ARM templates	855
6.4.6.5. Creating the Kubernetes manifest and Ignition config files	856
6.4.6.6. Optional: Creating a separate /var partition	860
6.4.7. Creating the Azure resource group	862
6.4.8. Uploading the RHCOS cluster image and bootstrap Ignition config file	863
6.4.9. Example for creating DNS zones	864
6.4.10. Creating a VNet in Azure Stack Hub	865
6.4.10.1. ARM template for the VNet	866
6.4.11. Deploying the RHCOS cluster image for the Azure Stack Hub infrastructure	866
6.4.11.1. ARM template for image storage	867
6.4.12. Networking requirements for user-provisioned infrastructure	867
6.4.12.1. Network connectivity requirements	867
6.4.13. Creating networking and load balancing components in Azure Stack Hub	868
6.4.13.1. ARM template for the network and load balancers	870
6.4.14. Creating the bootstrap machine in Azure Stack Hub	870
6.4.14.1. ARM template for the bootstrap machine	871
6.4.15. Creating the control plane machines in Azure Stack Hub	871
6.4.15.1. ARM template for control plane machines	872
6.4.16. Wait for bootstrap completion and remove bootstrap resources in Azure Stack Hub	873
6.4.17. Creating additional worker machines in Azure Stack Hub	874
6.4.17.1. ARM template for worker machines	875
6.4.18. Installing the OpenShift CLI by downloading the binary	875
Installing the OpenShift CLI on Linux	875
Installing the OpenShift CLI on Windows	876
Installing the OpenShift CLI on macOS	876
6.4.19. Logging in to the cluster by using the CLI	877
6.4.20. Approving the certificate signing requests for your machines	877
6.4.21. Adding the Ingress DNS records	880
6.4.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure	881
<b>CHAPTER 7. INSTALLING ON GCP</b> .....	<b>883</b>
7.1. PREPARING TO INSTALL ON GCP	883
7.1.1. Prerequisites	883
7.1.2. Requirements for installing OpenShift Container Platform on GCP	883
7.1.3. Choosing a method to install OpenShift Container Platform on GCP	883
7.1.3.1. Installing a cluster on installer-provisioned infrastructure	883
7.1.3.2. Installing a cluster on user-provisioned infrastructure	884
7.1.4. Next steps	884
7.2. CONFIGURING A GCP PROJECT	884
7.2.1. Creating a GCP project	884

---

7.2.2. Enabling API services in GCP	885
7.2.3. Configuring DNS for GCP	885
7.2.4. GCP account limits	886
7.2.5. Creating a service account in GCP	888
7.2.5.1. Required GCP permissions	888
7.2.6. Supported GCP regions	889
7.2.7. Next steps	890
7.3. MANUALLY CREATING IAM FOR GCP	890
7.3.1. Alternatives to storing administrator-level secrets in the kube-system project	890
7.3.2. Manually create IAM	891
7.3.3. Upgrading clusters with manually maintained credentials	893
7.3.4. Mint mode	895
7.3.5. Mint mode with removal or rotation of the administrator-level credential	895
7.3.6. Next steps	895
7.4. INSTALLING A CLUSTER QUICKLY ON GCP	896
7.4.1. Prerequisites	896
7.4.2. Internet access for OpenShift Container Platform	896
7.4.3. Generating a key pair for cluster node SSH access	896
7.4.4. Obtaining the installation program	898
7.4.5. Deploying the cluster	899
7.4.6. Installing the OpenShift CLI by downloading the binary	902
Installing the OpenShift CLI on Linux	902
Installing the OpenShift CLI on Windows	902
Installing the OpenShift CLI on macOS	903
7.4.7. Logging in to the cluster by using the CLI	903
7.4.8. Telemetry access for OpenShift Container Platform	904
7.4.9. Next steps	904
7.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS	904
7.5.1. Prerequisites	904
7.5.2. Internet access for OpenShift Container Platform	905
7.5.3. Generating a key pair for cluster node SSH access	905
7.5.4. Obtaining the installation program	907
7.5.5. Creating the installation configuration file	908
7.5.5.1. Installation configuration parameters	909
7.5.5.1.1. Required configuration parameters	910
7.5.5.1.2. Network configuration parameters	911
7.5.5.1.3. Optional configuration parameters	913
7.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	917
7.5.5.2. Minimum resource requirements for cluster installation	920
7.5.5.3. Using custom machine types	921
7.5.5.4. Sample customized install-config.yaml file for GCP	922
7.5.5.5. Configuring the cluster-wide proxy during installation	924
7.5.6. Using a GCP Marketplace image	925
7.5.7. Deploying the cluster	926
7.5.8. Installing the OpenShift CLI by downloading the binary	928
Installing the OpenShift CLI on Linux	928
Installing the OpenShift CLI on Windows	929
Installing the OpenShift CLI on macOS	929
7.5.9. Logging in to the cluster by using the CLI	930
7.5.10. Telemetry access for OpenShift Container Platform	930
7.5.11. Next steps	931
7.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS	931
7.6.1. Prerequisites	931

---

7.6.2. Internet access for OpenShift Container Platform	931
7.6.3. Generating a key pair for cluster node SSH access	932
7.6.4. Obtaining the installation program	934
7.6.5. Creating the installation configuration file	934
7.6.5.1. Installation configuration parameters	936
7.6.5.1.1. Required configuration parameters	936
7.6.5.1.2. Network configuration parameters	938
7.6.5.1.3. Optional configuration parameters	940
7.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	944
7.6.5.2. Minimum resource requirements for cluster installation	947
7.6.5.3. Using custom machine types	948
7.6.5.4. Sample customized install-config.yaml file for GCP	949
7.6.6. Additional resources	951
7.6.6.1. Configuring the cluster-wide proxy during installation	951
7.6.7. Network configuration phases	952
7.6.8. Specifying advanced network configuration	953
7.6.9. Cluster Network Operator configuration	954
7.6.9.1. Cluster Network Operator configuration object	954
defaultNetwork object configuration	955
Configuration for the OpenShift SDN CNI cluster network provider	956
Configuration for the OVN-Kubernetes CNI cluster network provider	957
kubeProxyConfig object configuration	958
7.6.10. Deploying the cluster	959
7.6.11. Installing the OpenShift CLI by downloading the binary	961
Installing the OpenShift CLI on Linux	961
Installing the OpenShift CLI on Windows	961
Installing the OpenShift CLI on macOS	962
7.6.12. Logging in to the cluster by using the CLI	962
7.6.13. Telemetry access for OpenShift Container Platform	963
7.6.14. Next steps	963
7.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK	963
7.7.1. Prerequisites	963
7.7.2. About installations in restricted networks	964
7.7.2.1. Additional limits	964
7.7.3. Internet access for OpenShift Container Platform	964
7.7.4. Generating a key pair for cluster node SSH access	965
7.7.5. Creating the installation configuration file	967
7.7.5.1. Installation configuration parameters	969
7.7.5.1.1. Required configuration parameters	969
7.7.5.1.2. Network configuration parameters	971
7.7.5.1.3. Optional configuration parameters	973
7.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters	977
7.7.5.2. Minimum resource requirements for cluster installation	980
7.7.5.3. Using custom machine types	981
7.7.5.4. Sample customized install-config.yaml file for GCP	982
7.7.5.5. Create an Ingress Controller with global access on GCP	984
7.7.5.6. Configuring the cluster-wide proxy during installation	986
7.7.6. Deploying the cluster	987
7.7.7. Installing the OpenShift CLI by downloading the binary	989
Installing the OpenShift CLI on Linux	989
Installing the OpenShift CLI on Windows	990
Installing the OpenShift CLI on macOS	990
7.7.8. Logging in to the cluster by using the CLI	991

---

7.7.9. Disabling the default OperatorHub sources	991
7.7.10. Telemetry access for OpenShift Container Platform	992
7.7.11. Next steps	992
7.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC	992
7.8.1. Prerequisites	992
7.8.2. About using a custom VPC	992
7.8.2.1. Requirements for using your VPC	993
7.8.2.2. VPC validation	993
7.8.2.3. Division of permissions	993
7.8.2.4. Isolation between clusters	993
7.8.3. Internet access for OpenShift Container Platform	994
7.8.4. Generating a key pair for cluster node SSH access	994
7.8.5. Obtaining the installation program	996
7.8.6. Creating the installation configuration file	997
7.8.6.1. Installation configuration parameters	998
7.8.6.1.1. Required configuration parameters	998
7.8.6.1.2. Network configuration parameters	1000
7.8.6.1.3. Optional configuration parameters	1002
7.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1006
7.8.6.2. Minimum resource requirements for cluster installation	1009
7.8.6.3. Using custom machine types	1010
7.8.6.4. Sample customized install-config.yaml file for GCP	1011
7.8.6.5. Create an Ingress Controller with global access on GCP	1013
7.8.7. Additional resources	1014
7.8.7.1. Configuring the cluster-wide proxy during installation	1014
7.8.8. Deploying the cluster	1016
7.8.9. Installing the OpenShift CLI by downloading the binary	1017
Installing the OpenShift CLI on Linux	1018
Installing the OpenShift CLI on Windows	1018
Installing the OpenShift CLI on macOS	1019
7.8.10. Logging in to the cluster by using the CLI	1019
7.8.11. Telemetry access for OpenShift Container Platform	1020
7.8.12. Next steps	1020
7.9. INSTALLING A PRIVATE CLUSTER ON GCP	1020
7.9.1. Prerequisites	1020
7.9.2. Private clusters	1020
7.9.2.1. Private clusters in GCP	1021
7.9.2.1.1. Limitations	1022
7.9.3. About using a custom VPC	1022
7.9.3.1. Requirements for using your VPC	1022
7.9.3.2. Division of permissions	1023
7.9.3.3. Isolation between clusters	1023
7.9.4. Internet access for OpenShift Container Platform	1023
7.9.5. Generating a key pair for cluster node SSH access	1024
7.9.6. Obtaining the installation program	1026
7.9.7. Manually creating the installation configuration file	1026
7.9.7.1. Installation configuration parameters	1027
7.9.7.1.1. Required configuration parameters	1028
7.9.7.1.2. Network configuration parameters	1029
7.9.7.1.3. Optional configuration parameters	1031
7.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1036
7.9.7.2. Minimum resource requirements for cluster installation	1039
7.9.7.3. Using custom machine types	1040

---

7.9.7.4. Sample customized install-config.yaml file for GCP	1041
7.9.7.5. Create an Ingress Controller with global access on GCP	1043
7.9.8. Additional resources	1044
7.9.8.1. Configuring the cluster-wide proxy during installation	1044
7.9.9. Deploying the cluster	1046
7.9.10. Installing the OpenShift CLI by downloading the binary	1047
Installing the OpenShift CLI on Linux	1047
Installing the OpenShift CLI on Windows	1048
Installing the OpenShift CLI on macOS	1048
7.9.11. Logging in to the cluster by using the CLI	1049
7.9.12. Telemetry access for OpenShift Container Platform	1049
7.9.13. Next steps	1050
7.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES	1050
7.10.1. Prerequisites	1050
7.10.2. Certificate signing requests management	1050
7.10.3. Internet access for OpenShift Container Platform	1051
7.10.4. Configuring your GCP project	1051
7.10.4.1. Creating a GCP project	1051
7.10.4.2. Enabling API services in GCP	1051
7.10.4.3. Configuring DNS for GCP	1052
7.10.4.4. GCP account limits	1053
7.10.4.5. Creating a service account in GCP	1054
7.10.4.5.1. Required GCP permissions	1055
7.10.4.6. Supported GCP regions	1056
7.10.4.7. Installing and configuring CLI tools for GCP	1057
7.10.5. Requirements for a cluster with user-provisioned infrastructure	1057
7.10.5.1. Required machines for cluster installation	1058
7.10.5.2. Minimum resource requirements for cluster installation	1058
7.10.5.3. Using custom machine types	1059
7.10.6. Creating the installation files for GCP	1059
7.10.6.1. Optional: Creating a separate /var partition	1059
7.10.6.2. Creating the installation configuration file	1062
7.10.6.3. Configuring the cluster-wide proxy during installation	1063
7.10.6.4. Creating the Kubernetes manifest and Ignition config files	1064
7.10.7. Exporting common variables	1067
7.10.7.1. Extracting the infrastructure name	1067
7.10.7.2. Exporting common variables for Deployment Manager templates	1067
7.10.8. Creating a VPC in GCP	1068
7.10.8.1. Deployment Manager template for the VPC	1069
7.10.9. Networking requirements for user-provisioned infrastructure	1070
7.10.9.1. Setting the cluster node hostnames through DHCP	1070
7.10.9.2. Network connectivity requirements	1070
7.10.10. Creating load balancers in GCP	1072
7.10.10.1. Deployment Manager template for the external load balancer	1074
7.10.10.2. Deployment Manager template for the internal load balancer	1074
7.10.11. Creating a private DNS zone in GCP	1076
7.10.11.1. Deployment Manager template for the private DNS	1077
7.10.12. Creating firewall rules in GCP	1078
7.10.12.1. Deployment Manager template for firewall rules	1079
7.10.13. Creating IAM roles in GCP	1081
7.10.13.1. Deployment Manager template for IAM roles	1083
7.10.14. Creating the RHCOS cluster image for the GCP infrastructure	1084

---

7.10.15. Creating the bootstrap machine in GCP	1084
7.10.15.1. Deployment Manager template for the bootstrap machine	1086
7.10.16. Creating the control plane machines in GCP	1088
7.10.16.1. Deployment Manager template for control plane machines	1090
7.10.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1092
7.10.18. Creating additional worker machines in GCP	1093
7.10.18.1. Deployment Manager template for worker machines	1095
7.10.19. Installing the OpenShift CLI by downloading the binary	1096
Installing the OpenShift CLI on Linux	1096
Installing the OpenShift CLI on Windows	1097
Installing the OpenShift CLI on macOS	1097
7.10.20. Logging in to the cluster by using the CLI	1097
7.10.21. Approving the certificate signing requests for your machines	1098
7.10.22. Optional: Adding the ingress DNS records	1101
7.10.23. Completing a GCP installation on user-provisioned infrastructure	1102
7.10.24. Telemetry access for OpenShift Container Platform	1105
7.10.25. Next steps	1105
7.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES	1105
7.11.1. Prerequisites	1106
7.11.2. Certificate signing requests management	1106
7.11.3. Internet access for OpenShift Container Platform	1106
7.11.4. Configuring the GCP project that hosts your cluster	1106
7.11.4.1. Creating a GCP project	1107
7.11.4.2. Enabling API services in GCP	1107
7.11.4.3. GCP account limits	1108
7.11.4.4. Creating a service account in GCP	1109
7.11.4.4.1. Required GCP permissions	1110
7.11.4.5. Supported GCP regions	1111
7.11.4.6. Installing and configuring CLI tools for GCP	1112
7.11.5. Requirements for a cluster with user-provisioned infrastructure	1112
7.11.5.1. Required machines for cluster installation	1112
7.11.5.2. Minimum resource requirements for cluster installation	1113
7.11.5.3. Using custom machine types	1114
7.11.6. Configuring the GCP project that hosts your shared VPC network	1114
7.11.6.1. Configuring DNS for GCP	1115
7.11.6.2. Creating a VPC in GCP	1116
7.11.6.2.1. Deployment Manager template for the VPC	1117
7.11.7. Creating the installation files for GCP	1118
7.11.7.1. Manually creating the installation configuration file	1119
7.11.7.2. Sample customized install-config.yaml file for GCP	1120
7.11.7.3. Configuring the cluster-wide proxy during installation	1122
7.11.7.4. Creating the Kubernetes manifest and Ignition config files	1123
7.11.8. Exporting common variables	1126
7.11.8.1. Extracting the infrastructure name	1126
7.11.8.2. Exporting common variables for Deployment Manager templates	1126
7.11.9. Networking requirements for user-provisioned infrastructure	1127
7.11.9.1. Setting the cluster node hostnames through DHCP	1127
7.11.9.2. Network connectivity requirements	1127
7.11.10. Creating load balancers in GCP	1129
7.11.10.1. Deployment Manager template for the external load balancer	1131
7.11.10.2. Deployment Manager template for the internal load balancer	1132
7.11.11. Creating a private DNS zone in GCP	1133

---

7.11.11.1. Deployment Manager template for the private DNS	1135
7.11.12. Creating firewall rules in GCP	1135
7.11.12.1. Deployment Manager template for firewall rules	1136
7.11.13. Creating IAM roles in GCP	1139
7.11.13.1. Deployment Manager template for IAM roles	1141
7.11.14. Creating the RHCOS cluster image for the GCP infrastructure	1141
7.11.15. Creating the bootstrap machine in GCP	1142
7.11.15.1. Deployment Manager template for the bootstrap machine	1144
7.11.16. Creating the control plane machines in GCP	1146
7.11.16.1. Deployment Manager template for control plane machines	1147
7.11.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1150
7.11.18. Creating additional worker machines in GCP	1150
7.11.18.1. Deployment Manager template for worker machines	1153
7.11.19. Installing the OpenShift CLI by downloading the binary	1154
Installing the OpenShift CLI on Linux	1154
Installing the OpenShift CLI on Windows	1154
Installing the OpenShift CLI on macOS	1155
7.11.20. Logging in to the cluster by using the CLI	1155
7.11.21. Approving the certificate signing requests for your machines	1156
7.11.22. Adding the ingress DNS records	1158
7.11.23. Adding ingress firewall rules	1160
7.11.23.1. Creating cluster-wide firewall rules for a shared VPC in GCP	1160
7.11.24. Completing a GCP installation on user-provisioned infrastructure	1161
7.11.25. Telemetry access for OpenShift Container Platform	1164
7.11.26. Next steps	1164
7.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	1164
7.12.1. Prerequisites	1165
7.12.2. About installations in restricted networks	1165
7.12.2.1. Additional limits	1166
7.12.3. Internet access for OpenShift Container Platform	1166
7.12.4. Configuring your GCP project	1166
7.12.4.1. Creating a GCP project	1166
7.12.4.2. Enabling API services in GCP	1167
7.12.4.3. Configuring DNS for GCP	1167
7.12.4.4. GCP account limits	1168
7.12.4.5. Creating a service account in GCP	1170
7.12.4.5.1. Required GCP permissions	1170
7.12.4.6. Supported GCP regions	1171
7.12.4.7. Installing and configuring CLI tools for GCP	1172
7.12.5. Requirements for a cluster with user-provisioned infrastructure	1173
7.12.5.1. Required machines for cluster installation	1173
7.12.5.2. Minimum resource requirements for cluster installation	1173
7.12.5.3. Using custom machine types	1174
7.12.6. Creating the installation files for GCP	1174
7.12.6.1. Optional: Creating a separate /var partition	1174
7.12.6.2. Creating the installation configuration file	1177
7.12.6.3. Configuring the cluster-wide proxy during installation	1179
7.12.6.4. Creating the Kubernetes manifest and Ignition config files	1181
7.12.7. Exporting common variables	1183
7.12.7.1. Extracting the infrastructure name	1183
7.12.7.2. Exporting common variables for Deployment Manager templates	1183
7.12.8. Creating a VPC in GCP	1184

7.12.8.1. Deployment Manager template for the VPC	1185
7.12.9. Networking requirements for user-provisioned infrastructure	1186
7.12.9.1. Setting the cluster node hostnames through DHCP	1186
7.12.9.2. Network connectivity requirements	1187
7.12.10. Creating load balancers in GCP	1188
7.12.10.1. Deployment Manager template for the external load balancer	1190
7.12.10.2. Deployment Manager template for the internal load balancer	1191
7.12.11. Creating a private DNS zone in GCP	1192
7.12.11.1. Deployment Manager template for the private DNS	1194
7.12.12. Creating firewall rules in GCP	1194
7.12.12.1. Deployment Manager template for firewall rules	1195
7.12.13. Creating IAM roles in GCP	1198
7.12.13.1. Deployment Manager template for IAM roles	1199
7.12.14. Creating the RHCOS cluster image for the GCP infrastructure	1200
7.12.15. Creating the bootstrap machine in GCP	1200
7.12.15.1. Deployment Manager template for the bootstrap machine	1203
7.12.16. Creating the control plane machines in GCP	1204
7.12.16.1. Deployment Manager template for control plane machines	1206
7.12.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1208
7.12.18. Creating additional worker machines in GCP	1209
7.12.18.1. Deployment Manager template for worker machines	1211
7.12.19. Logging in to the cluster by using the CLI	1212
7.12.20. Disabling the default OperatorHub sources	1212
7.12.21. Approving the certificate signing requests for your machines	1213
7.12.22. Optional: Adding the ingress DNS records	1216
7.12.23. Completing a GCP installation on user-provisioned infrastructure	1217
7.12.24. Telemetry access for OpenShift Container Platform	1220
7.12.25. Next steps	1220
7.13. UNINSTALLING A CLUSTER ON GCP	1220
7.13.1. Removing a cluster that uses installer-provisioned infrastructure	1220
<b>CHAPTER 8. INSTALLING ON BARE METAL</b> .....	<b>1222</b>
8.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION	1222
8.1.1. Prerequisites	1222
8.1.2. Planning a bare metal cluster for OpenShift Virtualization	1222
8.1.3. Choosing a method to install OpenShift Container Platform on bare metal	1222
8.1.3.1. Installing a cluster on installer-provisioned infrastructure	1223
8.1.3.2. Installing a cluster on user-provisioned infrastructure	1223
8.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL	1223
8.2.1. Prerequisites	1223
8.2.2. Internet access for OpenShift Container Platform	1224
8.2.3. Requirements for a cluster with user-provisioned infrastructure	1224
8.2.3.1. Required machines for cluster installation	1224
8.2.3.2. Minimum resource requirements for cluster installation	1225
8.2.3.3. Certificate signing requests management	1226
8.2.3.4. Networking requirements for user-provisioned infrastructure	1226
8.2.3.4.1. Setting the cluster node hostnames through DHCP	1226
8.2.3.4.2. Network connectivity requirements	1227
NTP configuration for user-provisioned infrastructure	1228
8.2.3.5. User-provisioned DNS requirements	1228
8.2.3.5.1. Example DNS configuration for user-provisioned clusters	1230
8.2.3.6. Load balancing requirements for user-provisioned infrastructure	1232
8.2.3.6.1. Example load balancer configuration for user-provisioned clusters	1234

8.2.4. Preparing the user-provisioned infrastructure	1236
8.2.5. Validating DNS resolution for user-provisioned infrastructure	1238
8.2.6. Generating a key pair for cluster node SSH access	1241
8.2.7. Obtaining the installation program	1242
8.2.8. Installing the OpenShift CLI by downloading the binary	1243
Installing the OpenShift CLI on Linux	1243
Installing the OpenShift CLI on Windows	1244
Installing the OpenShift CLI on macOS	1244
8.2.9. Manually creating the installation configuration file	1245
8.2.9.1. Installation configuration parameters	1246
8.2.9.1.1. Required configuration parameters	1246
8.2.9.1.2. Network configuration parameters	1247
8.2.9.1.3. Optional configuration parameters	1249
8.2.9.2. Sample install-config.yaml file for bare metal	1254
8.2.9.3. Configuring the cluster-wide proxy during installation	1256
8.2.9.4. Configuring a three-node cluster	1258
8.2.10. Creating the Kubernetes manifest and Ignition config files	1259
8.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1260
8.2.11.1. Installing RHCOS by using an ISO image	1261
8.2.11.2. Installing RHCOS by using PXE or iPXE booting	1265
8.2.11.3. Advanced RHCOS installation configuration	1269
8.2.11.3.1. Using advanced networking options for PXE and ISO installations	1269
8.2.11.3.2. Disk partitioning	1270
8.2.11.3.2.1. Creating a separate /var partition	1271
8.2.11.3.2.2. Retaining existing partitions	1273
8.2.11.3.3. Identifying Ignition configs	1274
8.2.11.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	1274
8.2.11.3.4. Advanced RHCOS installation reference	1275
8.2.11.3.4.1. Networking and bonding options for ISO installations	1275
Configuring DHCP or static IP addresses	1276
Configuring an IP address without a static hostname	1277
Specifying multiple network interfaces	1277
Configuring default gateway and route	1277
Disabling DHCP on a single interface	1277
Combining DHCP and static IP configurations	1278
Configuring VLANs on individual interfaces	1278
Providing multiple DNS servers	1278
Bonding multiple network interfaces to a single interface	1278
Bonding multiple network interfaces to a single interface	1279
Using network teaming	1279
8.2.11.3.4.2. coreos-installer options for ISO installations	1279
8.2.11.3.4.3. coreos.inst boot options for ISO or PXE installations	1282
8.2.11.4. Enabling multipathing with kernel arguments on RHCOS	1283
8.2.11.5. Updating the bootloader using bootupd	1285
8.2.12. Waiting for the bootstrap process to complete	1286
8.2.13. Logging in to the cluster by using the CLI	1287
8.2.14. Approving the certificate signing requests for your machines	1288
8.2.15. Initial Operator configuration	1291
8.2.15.1. Image registry removed during installation	1292
8.2.15.2. Image registry storage configuration	1292
8.2.15.2.1. Configuring registry storage for bare metal and other manual installations	1292
8.2.15.2.2. Configuring storage for the image registry in non-production clusters	1294
8.2.15.2.3. Configuring block registry storage	1295

---

8.2.16. Completing installation on user-provisioned infrastructure	1295
8.2.17. Telemetry access for OpenShift Container Platform	1298
8.2.18. Next steps	1298
8.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS	1298
8.3.1. Prerequisites	1298
8.3.2. Internet access for OpenShift Container Platform	1298
8.3.3. Requirements for a cluster with user-provisioned infrastructure	1299
8.3.3.1. Required machines for cluster installation	1299
8.3.3.2. Minimum resource requirements for cluster installation	1300
8.3.3.3. Certificate signing requests management	1300
8.3.3.4. Networking requirements for user-provisioned infrastructure	1301
8.3.3.4.1. Setting the cluster node hostnames through DHCP	1301
8.3.3.4.2. Network connectivity requirements	1302
NTP configuration for user-provisioned infrastructure	1303
8.3.3.5. User-provisioned DNS requirements	1303
8.3.3.5.1. Example DNS configuration for user-provisioned clusters	1305
8.3.3.6. Load balancing requirements for user-provisioned infrastructure	1307
8.3.3.6.1. Example load balancer configuration for user-provisioned clusters	1309
8.3.4. Preparing the user-provisioned infrastructure	1311
8.3.5. Validating DNS resolution for user-provisioned infrastructure	1313
8.3.6. Generating a key pair for cluster node SSH access	1315
8.3.7. Obtaining the installation program	1317
8.3.8. Installing the OpenShift CLI by downloading the binary	1318
Installing the OpenShift CLI on Linux	1318
Installing the OpenShift CLI on Windows	1319
Installing the OpenShift CLI on macOS	1319
8.3.9. Manually creating the installation configuration file	1320
8.3.9.1. Installation configuration parameters	1320
8.3.9.1.1. Required configuration parameters	1321
8.3.9.1.2. Network configuration parameters	1322
8.3.9.1.3. Optional configuration parameters	1324
8.3.9.2. Sample install-config.yaml file for bare metal	1329
8.3.10. Network configuration phases	1331
8.3.11. Specifying advanced network configuration	1332
8.3.12. Cluster Network Operator configuration	1333
8.3.12.1. Cluster Network Operator configuration object	1334
defaultNetwork object configuration	1334
Configuration for the OpenShift SDN CNI cluster network provider	1335
Configuration for the OVN-Kubernetes CNI cluster network provider	1336
kubeProxyConfig object configuration	1338
8.3.13. Creating the Ignition config files	1339
8.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1340
8.3.14.1. Installing RHCOS by using an ISO image	1341
8.3.14.2. Installing RHCOS by using PXE or iPXE booting	1344
8.3.14.3. Advanced RHCOS installation configuration	1348
8.3.14.3.1. Using advanced networking options for PXE and ISO installations	1348
8.3.14.3.2. Disk partitioning	1349
8.3.14.3.2.1. Creating a separate /var partition	1350
8.3.14.3.2.2. Retaining existing partitions	1352
8.3.14.3.3. Identifying Ignition configs	1353
8.3.14.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	1354
8.3.14.3.4. Advanced RHCOS installation reference	1355
8.3.14.3.4.1. Networking and bonding options for ISO installations	1355

---

Configuring DHCP or static IP addresses	1355
Configuring an IP address without a static hostname	1356
Specifying multiple network interfaces	1356
Configuring default gateway and route	1356
Disabling DHCP on a single interface	1357
Combining DHCP and static IP configurations	1357
Configuring VLANs on individual interfaces	1357
Providing multiple DNS servers	1357
Bonding multiple network interfaces to a single interface	1357
Bonding multiple network interfaces to a single interface	1358
Using network teaming	1358
8.3.14.3.4.2. coreos-installer options for ISO installations	1358
8.3.14.3.4.3. coreos.inst boot options for ISO or PXE installations	1361
8.3.14.4. Enabling multipathing with kernel arguments on RHCOS	1363
8.3.14.5. Updating the bootloader using bootupd	1364
8.3.15. Waiting for the bootstrap process to complete	1366
8.3.16. Logging in to the cluster by using the CLI	1367
8.3.17. Approving the certificate signing requests for your machines	1367
8.3.18. Initial Operator configuration	1370
8.3.18.1. Image registry removed during installation	1371
8.3.18.2. Image registry storage configuration	1371
8.3.18.3. Configuring block registry storage	1371
8.3.19. Completing installation on user-provisioned infrastructure	1372
8.3.20. Telemetry access for OpenShift Container Platform	1374
8.3.21. Next steps	1374
8.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK	1375
8.4.1. Prerequisites	1375
8.4.2. About installations in restricted networks	1375
8.4.2.1. Additional limits	1376
8.4.3. Internet access for OpenShift Container Platform	1376
8.4.4. Requirements for a cluster with user-provisioned infrastructure	1376
8.4.4.1. Required machines for cluster installation	1377
8.4.4.2. Minimum resource requirements for cluster installation	1377
8.4.4.3. Certificate signing requests management	1378
8.4.4.4. Networking requirements for user-provisioned infrastructure	1378
8.4.4.4.1. Setting the cluster node hostnames through DHCP	1379
8.4.4.4.2. Network connectivity requirements	1379
NTP configuration for user-provisioned infrastructure	1380
8.4.4.5. User-provisioned DNS requirements	1380
8.4.4.5.1. Example DNS configuration for user-provisioned clusters	1382
8.4.4.6. Load balancing requirements for user-provisioned infrastructure	1385
8.4.4.6.1. Example load balancer configuration for user-provisioned clusters	1387
8.4.5. Preparing the user-provisioned infrastructure	1389
8.4.6. Validating DNS resolution for user-provisioned infrastructure	1391
8.4.7. Generating a key pair for cluster node SSH access	1393
8.4.8. Manually creating the installation configuration file	1395
8.4.8.1. Installation configuration parameters	1396
8.4.8.1.1. Required configuration parameters	1397
8.4.8.1.2. Network configuration parameters	1398
8.4.8.1.3. Optional configuration parameters	1400
8.4.8.2. Sample install-config.yaml file for bare metal	1405
8.4.8.3. Configuring the cluster-wide proxy during installation	1408
8.4.8.4. Configuring a three-node cluster	1409

8.4.9. Creating the Kubernetes manifest and Ignition config files	1410
8.4.10. Configuring chrony time service	1412
8.4.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1413
8.4.11.1. Installing RHCOS by using an ISO image	1414
8.4.11.2. Installing RHCOS by using PXE or iPXE booting	1417
8.4.11.3. Advanced RHCOS installation configuration	1421
8.4.11.3.1. Using advanced networking options for PXE and ISO installations	1421
8.4.11.3.2. Disk partitioning	1422
8.4.11.3.2.1. Creating a separate /var partition	1423
8.4.11.3.2.2. Retaining existing partitions	1425
8.4.11.3.3. Identifying Ignition configs	1426
8.4.11.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	1427
8.4.11.3.4. Advanced RHCOS installation reference	1428
8.4.11.3.4.1. Networking and bonding options for ISO installations	1428
Configuring DHCP or static IP addresses	1428
Configuring an IP address without a static hostname	1429
Specifying multiple network interfaces	1429
Configuring default gateway and route	1429
Disabling DHCP on a single interface	1430
Combining DHCP and static IP configurations	1430
Configuring VLANs on individual interfaces	1430
Providing multiple DNS servers	1430
Bonding multiple network interfaces to a single interface	1430
Bonding multiple network interfaces to a single interface	1431
Using network teaming	1431
8.4.11.3.4.2. coreos-installer options for ISO installations	1431
8.4.11.3.4.3. coreos.inst boot options for ISO or PXE installations	1434
8.4.11.4. Enabling multipathing with kernel arguments on RHCOS	1436
8.4.11.5. Updating the bootloader using bootupd	1437
8.4.12. Waiting for the bootstrap process to complete	1439
8.4.13. Logging in to the cluster by using the CLI	1440
8.4.14. Approving the certificate signing requests for your machines	1440
8.4.15. Initial Operator configuration	1443
8.4.15.1. Disabling the default OperatorHub sources	1444
8.4.15.2. Image registry storage configuration	1444
8.4.15.2.1. Changing the image registry's management state	1445
8.4.15.2.2. Configuring registry storage for bare metal and other manual installations	1445
8.4.15.2.3. Configuring storage for the image registry in non-production clusters	1446
8.4.15.2.4. Configuring block registry storage	1447
8.4.16. Completing installation on user-provisioned infrastructure	1447
8.4.17. Telemetry access for OpenShift Container Platform	1450
8.4.18. Next steps	1450
<b>CHAPTER 9. INSTALLING ON A SINGLE NODE</b>	<b>1451</b>
9.1. PREPARING TO INSTALL ON A SINGLE NODE	1451
9.1.1. Prerequisites	1451
9.1.2. About OpenShift on a single node	1451
9.1.3. Requirements for installing OpenShift on a single node	1451
9.2. INSTALLING OPENSIFT ON A SINGLE NODE	1452
9.2.1. Generating the discovery ISO with the Assisted Installer	1452
9.2.2. Generating the discovery ISO manually	1453
9.2.3. Installing with USB media	1455
9.2.4. Monitoring the installation with the Assisted Installer	1456

9.2.5. Monitoring the installation manually	1456
<b>CHAPTER 10. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL</b> .....	<b>1458</b>
10.1. OVERVIEW	1458
10.2. PREREQUISITES	1459
10.2.1. Node requirements	1459
10.2.2. Planning a bare metal cluster for OpenShift Virtualization	1461
10.2.3. Firmware requirements for installing with virtual media	1461
10.2.4. Network requirements	1462
10.2.4.1. Increase the network MTU	1463
10.2.4.2. Configuring NICs	1463
10.2.4.3. DNS requirements	1464
10.2.4.4. Dynamic Host Configuration Protocol (DHCP) requirements	1465
10.2.4.5. Reserving IP addresses for nodes with the DHCP server	1465
10.2.4.6. Network Time Protocol (NTP)	1467
10.2.4.7. State-driven network configuration requirements (Technology Preview)	1467
10.2.4.8. Port access for the out-of-band management IP address	1467
10.2.5. Configuring nodes	1467
Configuring nodes when using the provisioning network	1467
Configuring nodes without the provisioning network	1468
Configuring nodes for Secure Boot manually	1469
Configuring the Compatibility Support Module for Fujitsu iRMC	1469
10.2.6. Out-of-band management	1470
10.2.7. Required data for installation	1470
10.2.8. Validation checklist for nodes	1470
10.3. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT INSTALLATION	1471
10.3.1. Installing RHEL on the provisioner node	1471
10.3.2. Preparing the provisioner node for OpenShift Container Platform installation	1471
10.3.3. Retrieving the OpenShift Container Platform installer	1474
10.3.4. Extracting the OpenShift Container Platform installer	1474
10.3.5. Creating an RHCOS images cache (optional)	1475
10.3.6. Configuration files	1477
10.3.6.1. Configuring the install-config.yaml file	1477
10.3.6.2. Setting proxy settings within the install-config.yaml file (optional)	1479
10.3.6.3. Modifying the install-config.yaml file for no provisioning network (optional)	1480
10.3.6.4. Modifying the install-config.yaml file for dual-stack network (optional)	1480
10.3.6.5. Configuring managed Secure Boot in the install-config.yaml file (optional)	1481
10.3.6.6. Additional install-config parameters	1481
Hosts	1486
10.3.6.7. BMC addressing	1486
IPMI	1486
Redfish network boot	1487
10.3.6.8. BMC addressing for Dell iDRAC	1487
BMC address formats for Dell iDRAC	1488
Redfish virtual media for Dell iDRAC	1488
Redfish network boot for iDRAC	1489
10.3.6.9. BMC addressing for HPE iLO	1490
Redfish virtual media for HPE iLO	1491
Redfish network boot for HPE iLO	1491
10.3.6.10. BMC addressing for Fujitsu iRMC	1492
10.3.6.11. Root device hints	1493
10.3.6.12. Creating the OpenShift Container Platform manifests	1494
10.3.6.13. Configuring NTP for disconnected clusters (optional)	1494

10.3.6.14. (Optional) Configure network components to run on the control plane	1496
10.3.6.15. Configuring BIOS for worker node	1498
10.3.7. Creating a disconnected registry (optional)	1499
10.3.7.1. Preparing the registry node to host the mirrored registry (optional)	1499
10.3.7.2. Generating the self-signed certificate (optional)	1499
10.3.7.3. Creating the registry podman container (optional)	1500
10.3.7.4. Copy and update the pull-secret (optional)	1501
10.3.7.5. Mirroring the repository (optional)	1501
10.3.7.6. Modify the install-config.yaml file to use the disconnected registry (optional)	1502
10.3.8. Deploying routers on worker nodes	1503
10.3.9. Validation checklist for installation	1504
10.3.10. Deploying the cluster via the OpenShift Container Platform installer	1504
10.3.11. Following the installation	1504
10.3.12. Verifying static IP address configuration	1504
10.4. INSTALLER-PROVISIONED POST-INSTALLATION CONFIGURATION	1505
10.4.1. Configuring NTP for disconnected clusters (optional)	1505
10.4.2. Enabling a provisioning network after installation	1508
10.4.3. Configuring an external load balancer	1509
10.5. EXPANDING THE CLUSTER	1512
10.5.1. Preparing the bare metal node	1512
10.5.2. Replacing a bare-metal control plane node	1514
10.5.3. Preparing to deploy with Virtual Media on the baremetal network	1517
10.5.4. Diagnosing a duplicate MAC address when provisioning a new host in the cluster	1519
10.5.5. Provisioning the bare metal node	1520
10.6. TROUBLESHOOTING	1522
10.6.1. Troubleshooting the installer workflow	1522
10.6.2. Troubleshooting install-config.yaml	1524
10.6.3. Bootstrap VM issues	1525
10.6.3.1. Bootstrap VM cannot boot up the cluster nodes	1526
10.6.3.2. Inspecting logs	1527
10.6.4. Cluster nodes will not PXE boot	1528
10.6.5. The API is not accessible	1529
10.6.6. Cleaning up previous installations	1529
10.6.7. Issues with creating the registry	1530
10.6.8. Miscellaneous issues	1531
10.6.8.1. Addressing the runtime network not ready error	1531
10.6.8.2. Cluster nodes not getting the correct IPv6 address over DHCP	1532
10.6.8.3. Cluster nodes not getting the correct hostname over DHCP	1532
10.6.8.4. Routes do not reach endpoints	1534
10.6.8.5. Failed Ignition during Firstboot	1535
10.6.8.6. NTP out of sync	1535
10.6.9. Reviewing the installation	1537
<b>CHAPTER 11. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON IBM CLOUD</b> .....	<b>1538</b>
11.1. PREREQUISITES	1538
11.1.1. Setting up IBM Cloud infrastructure	1538
Use one data center per cluster	1538
Create public and private VLANs	1538
Ensure subnets have sufficient IP addresses	1538
Configuring NICs	1539
Configuring canonical names	1540
Creating DNS entries	1540
Network Time Protocol (NTP)	1541

Configure a DHCP server	1541
Ensure BMC access privileges	1541
Create bare metal servers	1542
11.2. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT CONTAINER PLATFORM INSTALLATION	1542
11.2.1. Preparing the provisioner node for OpenShift Container Platform installation on IBM Cloud	1542
11.2.2. Configuring the public subnet	1546
11.2.3. Retrieving the OpenShift Container Platform installer	1548
11.2.4. Extracting the OpenShift Container Platform installer	1548
11.2.5. Configuring the install-config.yaml file	1549
11.2.6. Additional install-config parameters	1551
Hosts	1555
11.2.7. Root device hints	1556
11.2.8. Creating the OpenShift Container Platform manifests	1557
11.2.9. Deploying the cluster via the OpenShift Container Platform installer	1558
11.2.10. Following the installation	1558
<b>CHAPTER 12. INSTALLING WITH Z/VM ON IBM Z AND LINUXONE</b>	<b>1559</b>
12.1. PREPARING TO INSTALL WITH Z/VM ON IBM Z AND LINUXONE	1559
12.1.1. Prerequisites	1559
12.1.2. Choosing a method to install OpenShift Container Platform with z/VM on IBM Z or LinuxONE	1559
12.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE	1559
12.2.1. Prerequisites	1559
12.2.2. Internet access for OpenShift Container Platform	1560
12.2.3. Requirements for a cluster with user-provisioned infrastructure	1560
12.2.3.1. Required machines for cluster installation	1560
12.2.3.2. Minimum resource requirements for cluster installation	1561
12.2.3.3. Minimum IBM Z system environment	1561
Hardware requirements	1561
Operating system requirements	1562
IBM Z network connectivity requirements	1562
Disk storage for the z/VM guest virtual machines	1562
Storage / Main Memory	1562
12.2.3.4. Preferred IBM Z system environment	1562
Hardware requirements	1563
Operating system requirements	1563
IBM Z network connectivity requirements	1563
Disk storage for the z/VM guest virtual machines	1563
Storage / Main Memory	1563
12.2.3.5. Certificate signing requests management	1563
12.2.3.6. Networking requirements for user-provisioned infrastructure	1564
12.2.3.6.1. Network connectivity requirements	1564
NTP configuration for user-provisioned infrastructure	1565
12.2.3.7. User-provisioned DNS requirements	1566
12.2.3.7.1. Example DNS configuration for user-provisioned clusters	1567
12.2.3.8. Load balancing requirements for user-provisioned infrastructure	1569
12.2.3.8.1. Example load balancer configuration for user-provisioned clusters	1571
12.2.4. Preparing the user-provisioned infrastructure	1573
12.2.5. Validating DNS resolution for user-provisioned infrastructure	1575
12.2.6. Generating a key pair for cluster node SSH access	1577
12.2.7. Obtaining the installation program	1579
12.2.8. Installing the OpenShift CLI by downloading the binary	1580
Installing the OpenShift CLI on Linux	1580
Installing the OpenShift CLI on Windows	1580

Installing the OpenShift CLI on macOS	1581
12.2.9. Manually creating the installation configuration file	1581
12.2.9.1. Installation configuration parameters	1582
12.2.9.1.1. Required configuration parameters	1582
12.2.9.1.2. Network configuration parameters	1584
12.2.9.1.3. Optional configuration parameters	1586
12.2.9.2. Sample install-config.yaml file for IBM Z	1591
12.2.9.3. Configuring the cluster-wide proxy during installation	1593
12.2.9.4. Configuring a three-node cluster	1595
12.2.10. Cluster Network Operator configuration	1596
12.2.10.1. Cluster Network Operator configuration object	1596
defaultNetwork object configuration	1597
Configuration for the OpenShift SDN CNI cluster network provider	1598
Configuration for the OVN-Kubernetes CNI cluster network provider	1599
kubeProxyConfig object configuration	1601
12.2.11. Creating the Kubernetes manifest and Ignition config files	1601
12.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1603
12.2.12.1. Advanced RHCOS installation reference	1606
12.2.12.1.1. Networking and bonding options for ISO installations	1606
Configuring DHCP or static IP addresses	1607
Configuring an IP address without a static hostname	1608
Specifying multiple network interfaces	1608
Configuring default gateway and route	1608
Disabling DHCP on a single interface	1608
Combining DHCP and static IP configurations	1609
Configuring VLANs on individual interfaces	1609
Providing multiple DNS servers	1609
Bonding multiple network interfaces to a single interface	1609
Bonding multiple network interfaces to a single interface	1610
Using network teaming	1610
12.2.13. Waiting for the bootstrap process to complete	1610
12.2.14. Logging in to the cluster by using the CLI	1611
12.2.15. Approving the certificate signing requests for your machines	1612
12.2.16. Initial Operator configuration	1614
12.2.16.1. Image registry storage configuration	1615
12.2.16.1.1. Configuring registry storage for IBM Z	1615
12.2.16.1.2. Configuring storage for the image registry in non-production clusters	1617
12.2.17. Completing installation on user-provisioned infrastructure	1618
12.2.18. Telemetry access for OpenShift Container Platform	1620
12.2.19. Collecting debugging information	1620
12.2.20. Next steps	1621
12.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK	1621
12.3.1. Prerequisites	1621
12.3.2. About installations in restricted networks	1622
12.3.2.1. Additional limits	1622
12.3.3. Internet access for OpenShift Container Platform	1622
12.3.4. Requirements for a cluster with user-provisioned infrastructure	1623
12.3.4.1. Required machines for cluster installation	1623
12.3.4.2. Minimum resource requirements for cluster installation	1624
12.3.4.3. Minimum IBM Z system environment	1624
Hardware requirements	1624
Operating system requirements	1624
IBM Z network connectivity requirements	1625

Disk storage for the z/VM guest virtual machines	1625
Storage / Main Memory	1625
12.3.4.4. Preferred IBM Z system environment	1625
Hardware requirements	1625
Operating system requirements	1625
IBM Z network connectivity requirements	1626
Disk storage for the z/VM guest virtual machines	1626
Storage / Main Memory	1626
12.3.4.5. Certificate signing requests management	1626
12.3.4.6. Networking requirements for user-provisioned infrastructure	1626
12.3.4.6.1. Setting the cluster node hostnames through DHCP	1627
12.3.4.6.2. Network connectivity requirements	1627
NTP configuration for user-provisioned infrastructure	1628
12.3.4.7. User-provisioned DNS requirements	1629
12.3.4.7.1. Example DNS configuration for user-provisioned clusters	1630
12.3.4.8. Load balancing requirements for user-provisioned infrastructure	1632
12.3.4.8.1. Example load balancer configuration for user-provisioned clusters	1634
12.3.5. Preparing the user-provisioned infrastructure	1636
12.3.6. Validating DNS resolution for user-provisioned infrastructure	1638
12.3.7. Generating a key pair for cluster node SSH access	1640
12.3.8. Manually creating the installation configuration file	1642
12.3.8.1. Installation configuration parameters	1643
12.3.8.1.1. Required configuration parameters	1643
12.3.8.1.2. Network configuration parameters	1644
12.3.8.1.3. Optional configuration parameters	1646
12.3.8.2. Sample install-config.yaml file for IBM Z	1651
12.3.8.3. Configuring the cluster-wide proxy during installation	1654
12.3.8.4. Configuring a three-node cluster	1655
12.3.9. Cluster Network Operator configuration	1656
12.3.9.1. Cluster Network Operator configuration object	1657
defaultNetwork object configuration	1657
Configuration for the OpenShift SDN CNI cluster network provider	1658
Configuration for the OVN-Kubernetes CNI cluster network provider	1659
kubeProxyConfig object configuration	1661
12.3.10. Creating the Kubernetes manifest and Ignition config files	1662
12.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1664
12.3.11.1. Advanced RHCOS installation reference	1667
12.3.11.1.1. Networking and bonding options for ISO installations	1667
Configuring DHCP or static IP addresses	1667
Configuring an IP address without a static hostname	1668
Specifying multiple network interfaces	1668
Configuring default gateway and route	1668
Disabling DHCP on a single interface	1669
Combining DHCP and static IP configurations	1669
Configuring VLANs on individual interfaces	1669
Providing multiple DNS servers	1669
Bonding multiple network interfaces to a single interface	1669
Bonding multiple network interfaces to a single interface	1670
Using network teaming	1670
12.3.12. Waiting for the bootstrap process to complete	1670
12.3.13. Logging in to the cluster by using the CLI	1671
12.3.14. Approving the certificate signing requests for your machines	1672
12.3.15. Initial Operator configuration	1675

12.3.15.1. Disabling the default OperatorHub sources	1675
12.3.15.2. Image registry storage configuration	1676
12.3.15.2.1. Configuring registry storage for IBM Z	1676
12.3.15.2.2. Configuring storage for the image registry in non-production clusters	1678
12.3.16. Completing installation on user-provisioned infrastructure	1678
12.3.17. Telemetry access for OpenShift Container Platform	1681
12.3.18. Collecting debugging information	1681
12.3.19. Next steps	1681
<b>CHAPTER 13. INSTALLING WITH RHEL KVM ON IBM Z AND LINUXONE</b> .....	<b>1683</b>
13.1. PREPARING TO INSTALL WITH RHEL KVM ON IBM Z AND LINUXONE	1683
13.1.1. Prerequisites	1683
13.1.2. Choosing a method to install OpenShift Container Platform with RHEL KVM on IBM Z or LinuxONE	1683
13.2. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE	1683
13.2.1. Prerequisites	1683
13.2.2. Internet access for OpenShift Container Platform	1684
13.2.3. Machine requirements for a cluster with user-provisioned infrastructure	1684
13.2.3.1. Required machines	1684
13.2.3.2. Network connectivity requirements	1685
13.2.3.3. IBM Z network connectivity requirements	1685
13.2.3.4. Host machine resource requirements	1685
13.2.3.5. Minimum IBM Z system environment	1686
Hardware requirements	1686
Operating system requirements	1686
13.2.3.6. Minimum resource requirements	1686
13.2.3.7. Preferred IBM Z system environment	1687
Hardware requirements	1687
Operating system requirements	1687
13.2.3.8. Preferred resource requirements	1687
13.2.3.9. Certificate signing requests management	1687
13.2.3.10. Networking requirements for user-provisioned infrastructure	1688
13.2.3.10.1. Setting the cluster node hostnames through DHCP	1688
13.2.3.10.2. Network connectivity requirements	1688
NTP configuration for user-provisioned infrastructure	1690
13.2.3.11. User-provisioned DNS requirements	1690
13.2.3.11.1. Example DNS configuration for user-provisioned clusters	1692
13.2.3.12. Load balancing requirements for user-provisioned infrastructure	1694
13.2.3.12.1. Example load balancer configuration for user-provisioned clusters	1696
13.2.4. Preparing the user-provisioned infrastructure	1698
13.2.5. Validating DNS resolution for user-provisioned infrastructure	1700
13.2.6. Generating a key pair for cluster node SSH access	1702
13.2.7. Obtaining the installation program	1704
13.2.8. Installing the OpenShift CLI by downloading the binary	1705
Installing the OpenShift CLI on Linux	1705
Installing the OpenShift CLI on Windows	1705
Installing the OpenShift CLI on macOS	1706
13.2.9. Manually creating the installation configuration file	1706
13.2.9.1. Installation configuration parameters	1707
13.2.9.1.1. Required configuration parameters	1707
13.2.9.1.2. Network configuration parameters	1709
13.2.9.1.3. Optional configuration parameters	1711
13.2.9.2. Sample install-config.yaml file for IBM Z	1716

13.2.9.3. Configuring the cluster-wide proxy during installation	1718
13.2.9.4. Configuring a three-node cluster	1720
13.2.10. Cluster Network Operator configuration	1721
13.2.10.1. Cluster Network Operator configuration object	1721
defaultNetwork object configuration	1722
Configuration for the OpenShift SDN CNI cluster network provider	1723
Configuration for the OVN-Kubernetes CNI cluster network provider	1724
kubeProxyConfig object configuration	1726
13.2.11. Creating the Kubernetes manifest and Ignition config files	1726
13.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1728
13.2.12.1. Fast-track installation by using a prepackaged QCOW2 disk image	1728
13.2.12.2. Full installation on a new QCOW2 disk image	1729
13.2.12.3. Advanced RHCOS installation reference	1731
13.2.12.3.1. Networking options for ISO installations	1731
Configuring DHCP or static IP addresses	1731
Configuring an IP address without a static hostname	1732
Specifying multiple network interfaces	1732
Configuring default gateway and route	1732
Disabling DHCP on a single interface	1733
Combining DHCP and static IP configurations	1733
Configuring VLANs on individual interfaces	1733
Providing multiple DNS servers	1733
13.2.13. Waiting for the bootstrap process to complete	1733
13.2.14. Logging in to the cluster by using the CLI	1734
13.2.15. Approving the certificate signing requests for your machines	1735
13.2.16. Initial Operator configuration	1737
13.2.16.1. Image registry storage configuration	1738
13.2.16.1.1. Configuring registry storage for IBM Z	1739
13.2.16.1.2. Configuring storage for the image registry in non-production clusters	1740
13.2.17. Completing installation on user-provisioned infrastructure	1741
13.2.18. Telemetry access for OpenShift Container Platform	1743
13.2.19. Collecting debugging information	1743
13.2.20. Next steps	1744
13.3. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND LINUXONE IN A RESTRICTED NETWORK	1744
13.3.1. Prerequisites	1744
13.3.2. About installations in restricted networks	1745
13.3.2.1. Additional limits	1746
13.3.3. Internet access for OpenShift Container Platform	1746
13.3.4. Machine requirements for a cluster with user-provisioned infrastructure	1746
13.3.4.1. Required machines	1746
13.3.4.2. Network connectivity requirements	1747
13.3.4.3. IBM Z network connectivity requirements	1747
13.3.4.4. Host machine resource requirements	1747
13.3.4.5. Minimum IBM Z system environment	1748
Hardware requirements	1748
Operating system requirements	1748
13.3.4.6. Minimum resource requirements	1748
13.3.4.7. Preferred IBM Z system environment	1748
Hardware requirements	1749
Operating system requirements	1749
13.3.4.8. Preferred resource requirements	1749
13.3.4.9. Certificate signing requests management	1749

13.3.4.10. Networking requirements for user-provisioned infrastructure	1750
13.3.4.10.1. Setting the cluster node hostnames through DHCP	1750
13.3.4.10.2. Network connectivity requirements	1750
NTP configuration for user-provisioned infrastructure	1751
13.3.4.11. User-provisioned DNS requirements	1752
13.3.4.11.1. Example DNS configuration for user-provisioned clusters	1753
13.3.4.12. Load balancing requirements for user-provisioned infrastructure	1756
13.3.4.12.1. Example load balancer configuration for user-provisioned clusters	1758
13.3.5. Preparing the user-provisioned infrastructure	1760
13.3.6. Validating DNS resolution for user-provisioned infrastructure	1761
13.3.7. Generating a key pair for cluster node SSH access	1764
13.3.8. Manually creating the installation configuration file	1765
13.3.8.1. Installation configuration parameters	1766
13.3.8.1.1. Required configuration parameters	1767
13.3.8.1.2. Network configuration parameters	1768
13.3.8.1.3. Optional configuration parameters	1770
13.3.8.2. Sample install-config.yaml file for IBM Z	1775
13.3.8.3. Configuring the cluster-wide proxy during installation	1778
13.3.8.4. Configuring a three-node cluster	1779
13.3.9. Cluster Network Operator configuration	1780
13.3.9.1. Cluster Network Operator configuration object	1781
defaultNetwork object configuration	1782
Configuration for the OpenShift SDN CNI cluster network provider	1782
Configuration for the OVN-Kubernetes CNI cluster network provider	1783
kubeProxyConfig object configuration	1785
13.3.10. Creating the Kubernetes manifest and Ignition config files	1785
13.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1787
13.3.11.1. Fast-track installation by using a prepackaged QCOW2 disk image	1787
13.3.11.2. Full installation on a new QCOW2 disk image	1788
13.3.11.3. Advanced RHCOS installation reference	1790
13.3.11.3.1. Networking options for ISO installations	1790
Configuring DHCP or static IP addresses	1790
Configuring an IP address without a static hostname	1791
Specifying multiple network interfaces	1791
Configuring default gateway and route	1791
Disabling DHCP on a single interface	1792
Combining DHCP and static IP configurations	1792
Configuring VLANs on individual interfaces	1792
Providing multiple DNS servers	1792
13.3.12. Waiting for the bootstrap process to complete	1792
13.3.13. Logging in to the cluster by using the CLI	1793
13.3.14. Approving the certificate signing requests for your machines	1794
13.3.15. Initial Operator configuration	1796
13.3.15.1. Disabling the default OperatorHub sources	1797
13.3.15.2. Image registry storage configuration	1798
13.3.15.2.1. Configuring registry storage for IBM Z	1798
13.3.15.2.2. Configuring storage for the image registry in non-production clusters	1800
13.3.16. Completing installation on user-provisioned infrastructure	1800
13.3.17. Telemetry access for OpenShift Container Platform	1803
13.3.18. Collecting debugging information	1803
13.3.19. Next steps	1803
<b>CHAPTER 14. INSTALLING ON IBM POWER</b>	<b>1805</b>

14.1. PREPARING TO INSTALL ON IBM POWER	1805
14.1.1. Prerequisites	1805
14.1.2. Choosing a method to install OpenShift Container Platform on IBM Power	1805
14.2. INSTALLING A CLUSTER ON IBM POWER	1805
14.2.1. Prerequisites	1805
14.2.2. Internet access for OpenShift Container Platform	1806
14.2.3. Requirements for a cluster with user-provisioned infrastructure	1806
14.2.3.1. Required machines for cluster installation	1806
14.2.3.2. Minimum resource requirements for cluster installation	1807
14.2.3.3. Minimum IBM Power requirements	1807
Hardware requirements	1807
Operating system requirements	1807
Disk storage for the IBM Power guest virtual machines	1808
Network for the PowerVM guest virtual machines	1808
Storage / main memory	1808
14.2.3.4. Recommended IBM Power system requirements	1808
Hardware requirements	1808
Operating system requirements	1808
Disk storage for the IBM Power guest virtual machines	1808
Network for the PowerVM guest virtual machines	1808
Storage / main memory	1808
14.2.3.5. Certificate signing requests management	1809
14.2.3.6. Networking requirements for user-provisioned infrastructure	1809
14.2.3.6.1. Setting the cluster node hostnames through DHCP	1809
14.2.3.6.2. Network connectivity requirements	1810
NTP configuration for user-provisioned infrastructure	1811
14.2.3.7. User-provisioned DNS requirements	1811
14.2.3.7.1. Example DNS configuration for user-provisioned clusters	1813
14.2.3.8. Load balancing requirements for user-provisioned infrastructure	1815
14.2.3.8.1. Example load balancer configuration for user-provisioned clusters	1817
14.2.4. Preparing the user-provisioned infrastructure	1819
14.2.5. Validating DNS resolution for user-provisioned infrastructure	1821
14.2.6. Generating a key pair for cluster node SSH access	1823
14.2.7. Obtaining the installation program	1825
14.2.8. Installing the OpenShift CLI by downloading the binary	1826
Installing the OpenShift CLI on Linux	1826
Installing the OpenShift CLI on Windows	1826
Installing the OpenShift CLI on macOS	1827
14.2.9. Manually creating the installation configuration file	1827
14.2.9.1. Installation configuration parameters	1828
14.2.9.1.1. Required configuration parameters	1828
14.2.9.1.2. Network configuration parameters	1830
14.2.9.1.3. Optional configuration parameters	1832
14.2.9.2. Sample install-config.yaml file for IBM Power	1837
14.2.9.3. Configuring the cluster-wide proxy during installation	1839
14.2.9.4. Configuring a three-node cluster	1841
14.2.10. Cluster Network Operator configuration	1842
14.2.10.1. Cluster Network Operator configuration object	1842
defaultNetwork object configuration	1843
Configuration for the OpenShift SDN CNI cluster network provider	1843
Configuration for the OVN-Kubernetes CNI cluster network provider	1845
kubeProxyConfig object configuration	1846
14.2.11. Creating the Kubernetes manifest and Ignition config files	1847

14.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1849
14.2.12.1. Installing RHCOS by using an ISO image	1849
14.2.12.1.1. Advanced RHCOS installation reference	1852
14.2.12.1.1.1. Networking and bonding options for ISO installations	1852
Configuring DHCP or static IP addresses	1853
Configuring an IP address without a static hostname	1853
Specifying multiple network interfaces	1854
Configuring default gateway and route	1854
Disabling DHCP on a single interface	1854
Combining DHCP and static IP configurations	1854
Configuring VLANs on individual interfaces	1854
Providing multiple DNS servers	1855
Bonding multiple network interfaces to a single interface	1855
Bonding multiple network interfaces to a single interface	1855
Using network teaming	1855
14.2.12.2. Installing RHCOS by using PXE booting	1856
14.2.12.3. Enabling multipathing with kernel arguments on RHCOS	1859
14.2.13. Waiting for the bootstrap process to complete	1860
14.2.14. Logging in to the cluster by using the CLI	1861
14.2.15. Approving the certificate signing requests for your machines	1862
14.2.16. Initial Operator configuration	1865
14.2.16.1. Image registry storage configuration	1866
14.2.16.1.1. Configuring registry storage for IBM Power	1866
14.2.16.1.2. Configuring storage for the image registry in non-production clusters	1867
14.2.17. Completing installation on user-provisioned infrastructure	1868
14.2.18. Telemetry access for OpenShift Container Platform	1871
14.2.19. Next steps	1871
14.3. INSTALLING A CLUSTER ON IBM POWER IN A RESTRICTED NETWORK	1871
14.3.1. Prerequisites	1871
14.3.2. About installations in restricted networks	1872
14.3.2.1. Additional limits	1872
14.3.3. Internet access for OpenShift Container Platform	1872
14.3.4. Requirements for a cluster with user-provisioned infrastructure	1873
14.3.4.1. Required machines for cluster installation	1873
14.3.4.2. Minimum resource requirements for cluster installation	1873
14.3.4.3. Minimum IBM Power requirements	1874
Hardware requirements	1874
Operating system requirements	1874
Disk storage for the IBM Power guest virtual machines	1874
Network for the PowerVM guest virtual machines	1874
Storage / main memory	1875
14.3.4.4. Recommended IBM Power system requirements	1875
Hardware requirements	1875
Operating system requirements	1875
Disk storage for the IBM Power guest virtual machines	1875
Network for the PowerVM guest virtual machines	1875
Storage / main memory	1875
14.3.4.5. Certificate signing requests management	1875
14.3.4.6. Networking requirements for user-provisioned infrastructure	1876
14.3.4.6.1. Setting the cluster node hostnames through DHCP	1876
14.3.4.6.2. Network connectivity requirements	1876
NTP configuration for user-provisioned infrastructure	1877
14.3.4.7. User-provisioned DNS requirements	1878

14.3.4.7.1. Example DNS configuration for user-provisioned clusters	1880
14.3.4.8. Load balancing requirements for user-provisioned infrastructure	1882
14.3.4.8.1. Example load balancer configuration for user-provisioned clusters	1884
14.3.5. Preparing the user-provisioned infrastructure	1886
14.3.6. Validating DNS resolution for user-provisioned infrastructure	1888
14.3.7. Generating a key pair for cluster node SSH access	1890
14.3.8. Manually creating the installation configuration file	1892
14.3.8.1. Installation configuration parameters	1893
14.3.8.1.1. Required configuration parameters	1893
14.3.8.1.2. Network configuration parameters	1894
14.3.8.1.3. Optional configuration parameters	1896
14.3.8.2. Sample install-config.yaml file for IBM Power	1901
14.3.8.3. Configuring the cluster-wide proxy during installation	1904
14.3.8.4. Configuring a three-node cluster	1905
14.3.9. Cluster Network Operator configuration	1906
14.3.9.1. Cluster Network Operator configuration object	1906
defaultNetwork object configuration	1907
Configuration for the OpenShift SDN CNI cluster network provider	1908
Configuration for the OVN-Kubernetes CNI cluster network provider	1909
kubeProxyConfig object configuration	1911
14.3.10. Creating the Kubernetes manifest and Ignition config files	1912
14.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	1914
14.3.11.1. Installing RHCOS by using an ISO image	1914
14.3.11.1.1. Advanced RHCOS installation reference	1917
14.3.11.1.1.1. Networking and bonding options for ISO installations	1917
Configuring DHCP or static IP addresses	1918
Configuring an IP address without a static hostname	1918
Specifying multiple network interfaces	1919
Configuring default gateway and route	1919
Disabling DHCP on a single interface	1919
Combining DHCP and static IP configurations	1919
Configuring VLANs on individual interfaces	1919
Providing multiple DNS servers	1920
Bonding multiple network interfaces to a single interface	1920
Bonding multiple network interfaces to a single interface	1920
Using network teaming	1920
14.3.11.2. Installing RHCOS by using PXE booting	1921
14.3.11.3. Enabling multipathing with kernel arguments on RHCOS	1924
14.3.12. Waiting for the bootstrap process to complete	1925
14.3.13. Logging in to the cluster by using the CLI	1926
14.3.14. Approving the certificate signing requests for your machines	1927
14.3.15. Initial Operator configuration	1930
14.3.15.1. Disabling the default OperatorHub sources	1931
14.3.15.2. Image registry storage configuration	1931
14.3.15.2.1. Changing the image registry's management state	1931
14.3.15.2.2. Configuring registry storage for IBM Power	1932
14.3.15.2.3. Configuring storage for the image registry in non-production clusters	1933
14.3.16. Completing installation on user-provisioned infrastructure	1934
14.3.17. Telemetry access for OpenShift Container Platform	1936
14.3.18. Next steps	1936
<b>CHAPTER 15. INSTALLING ON OPENSTACK</b> .....	<b>1937</b>
15.1. PREPARING TO INSTALL ON OPENSTACK	1937

15.1.1. Prerequisites	1937
15.1.2. Choosing a method to install OpenShift Container Platform on OpenStack	1937
15.1.2.1. Installing a cluster on installer-provisioned infrastructure	1937
15.1.2.2. Installing a cluster on user-provisioned infrastructure	1937
15.2. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS	1938
15.2.1. Prerequisites	1938
15.2.2. Resource guidelines for installing OpenShift Container Platform on RHOSP	1938
15.2.2.1. Control plane machines	1939
15.2.2.2. Compute machines	1939
15.2.2.3. Bootstrap machine	1940
15.2.3. Internet access for OpenShift Container Platform	1940
15.2.4. Enabling Swift on RHOSP	1941
15.2.5. Configuring an image registry with custom storage on clusters that run on RHOSP	1941
15.2.6. Verifying external network access	1943
15.2.7. Defining parameters for the installation program	1944
15.2.8. Setting cloud provider options	1946
15.2.9. Obtaining the installation program	1947
15.2.10. Creating the installation configuration file	1948
15.2.10.1. Configuring the cluster-wide proxy during installation	1949
15.2.11. Installation configuration parameters	1951
15.2.11.1. Required configuration parameters	1951
15.2.11.2. Network configuration parameters	1953
15.2.11.3. Optional configuration parameters	1954
15.2.11.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	1959
15.2.11.5. Optional RHOSP configuration parameters	1960
15.2.11.6. Custom subnets in RHOSP deployments	1964
15.2.11.7. Deploying a cluster with bare metal machines	1965
15.2.11.8. Cluster deployment on RHOSP provider networks	1966
15.2.11.8.1. RHOSP provider network requirements for cluster installation	1967
15.2.11.8.2. Deploying a cluster that has a primary interface on a provider network	1968
15.2.11.9. Sample customized install-config.yaml file for RHOSP	1970
15.2.12. Setting compute machine affinity	1970
15.2.13. Generating a key pair for cluster node SSH access	1972
15.2.14. Enabling access to the environment	1974
15.2.14.1. Enabling access with floating IP addresses	1974
15.2.14.2. Completing installation without floating IP addresses	1975
15.2.15. Deploying the cluster	1976
15.2.16. Verifying cluster status	1977
15.2.17. Logging in to the cluster by using the CLI	1978
15.2.18. Telemetry access for OpenShift Container Platform	1979
15.2.19. Next steps	1979
15.3. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR	1979
15.3.1. Prerequisites	1979
15.3.2. About Kuryr SDN	1980
15.3.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr	1980
15.3.3.1. Increasing quota	1982
15.3.3.2. Configuring Neutron	1982
15.3.3.3. Configuring Octavia	1983
15.3.3.3.1. The Octavia OVN Driver	1986
15.3.3.4. Known limitations of installing with Kuryr	1987
RHOSP general limitations	1987
RHOSP version limitations	1987
RHOSP environment limitations	1987

RHOSP upgrade limitations	1988
15.3.3.5. Control plane machines	1988
15.3.3.6. Compute machines	1988
15.3.3.7. Bootstrap machine	1989
15.3.4. Internet access for OpenShift Container Platform	1989
15.3.5. Enabling Swift on RHOSP	1990
15.3.6. Verifying external network access	1990
15.3.7. Defining parameters for the installation program	1991
15.3.8. Setting cloud provider options	1993
15.3.9. Obtaining the installation program	1994
15.3.10. Creating the installation configuration file	1995
15.3.10.1. Configuring the cluster-wide proxy during installation	1996
15.3.11. Installation configuration parameters	1998
15.3.11.1. Required configuration parameters	1998
15.3.11.2. Network configuration parameters	2000
15.3.11.3. Optional configuration parameters	2001
15.3.11.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2006
15.3.11.5. Optional RHOSP configuration parameters	2007
15.3.11.6. Custom subnets in RHOSP deployments	2011
15.3.11.7. Sample customized install-config.yaml file for RHOSP with Kuryr	2012
15.3.11.8. Cluster deployment on RHOSP provider networks	2013
15.3.11.8.1. RHOSP provider network requirements for cluster installation	2014
15.3.11.8.2. Deploying a cluster that has a primary interface on a provider network	2015
15.3.11.9. Kuryr ports pools	2016
15.3.11.10. Adjusting Kuryr ports pools during installation	2016
15.3.12. Setting compute machine affinity	2018
15.3.13. Generating a key pair for cluster node SSH access	2020
15.3.14. Enabling access to the environment	2022
15.3.14.1. Enabling access with floating IP addresses	2022
15.3.14.2. Completing installation without floating IP addresses	2023
15.3.15. Deploying the cluster	2024
15.3.16. Verifying cluster status	2025
15.3.17. Logging in to the cluster by using the CLI	2026
15.3.18. Telemetry access for OpenShift Container Platform	2027
15.3.19. Next steps	2027
15.4. INSTALLING A CLUSTER ON OPENSTACK THAT SUPPORTS SR-IOV-CONNECTED COMPUTE MACHINES	2027
15.4.1. Prerequisites	2027
15.4.2. Resource guidelines for installing OpenShift Container Platform on RHOSP	2028
15.4.2.1. Control plane machines	2029
15.4.2.2. Compute machines	2029
15.4.2.3. Bootstrap machine	2029
15.4.3. Internet access for OpenShift Container Platform	2030
15.4.4. Enabling Swift on RHOSP	2030
15.4.5. Verifying external network access	2031
15.4.6. Defining parameters for the installation program	2031
15.4.7. Obtaining the installation program	2033
15.4.8. Creating the installation configuration file	2033
15.4.8.1. Configuring the cluster-wide proxy during installation	2034
15.4.9. Installation configuration parameters	2036
15.4.9.1. Required configuration parameters	2036
15.4.9.2. Network configuration parameters	2038
15.4.9.3. Optional configuration parameters	2040

---

15.4.9.4. Custom subnets in RHOSP deployments	2045
15.4.9.5. Deploying a cluster with bare metal machines	2046
15.4.9.6. Sample customized install-config.yaml file for RHOSP	2047
15.4.10. Generating a key pair for cluster node SSH access	2048
15.4.11. Enabling access to the environment	2050
15.4.11.1. Enabling access with floating IP addresses	2050
15.4.11.2. Completing installation without floating IP addresses	2051
15.4.12. Creating SR-IOV networks for compute machines	2052
15.4.13. Deploying the cluster	2053
15.4.14. Verifying cluster status	2054
15.4.15. Logging in to the cluster by using the CLI	2055
15.4.16. Preparing a cluster that runs on RHOSP for SR-IOV	2055
15.4.16.1. Enabling the RHOSP metadata service as a mountable drive	2055
15.4.16.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver	2056
15.4.17. Telemetry access for OpenShift Container Platform	2057
15.4.18. Next steps	2057
15.5. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN INFRASTRUCTURE	2058
15.5.1. Prerequisites	2058
15.5.2. Internet access for OpenShift Container Platform	2058
15.5.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	2059
15.5.3.1. Control plane machines	2060
15.5.3.2. Compute machines	2060
15.5.3.3. Bootstrap machine	2060
15.5.4. Downloading playbook dependencies	2061
15.5.5. Downloading the installation playbooks	2062
15.5.6. Obtaining the installation program	2063
15.5.7. Generating a key pair for cluster node SSH access	2064
15.5.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	2065
15.5.9. Verifying external network access	2067
15.5.10. Enabling access to the environment	2067
15.5.10.1. Enabling access with floating IP addresses	2067
15.5.10.2. Completing installation without floating IP addresses	2069
15.5.11. Defining parameters for the installation program	2069
15.5.12. Creating the installation configuration file	2071
15.5.13. Installation configuration parameters	2072
15.5.13.1. Required configuration parameters	2072
15.5.13.2. Network configuration parameters	2074
15.5.13.3. Optional configuration parameters	2075
15.5.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2080
15.5.13.5. Optional RHOSP configuration parameters	2081
15.5.13.6. Custom subnets in RHOSP deployments	2085
15.5.13.7. Sample customized install-config.yaml file for RHOSP	2086
15.5.13.8. Setting a custom subnet for machines	2086
15.5.13.9. Emptying compute machine pools	2087
15.5.13.10. Cluster deployment on RHOSP provider networks	2088
15.5.13.10.1. RHOSP provider network requirements for cluster installation	2089
15.5.13.10.2. Deploying a cluster that has a primary interface on a provider network	2090
15.5.14. Creating the Kubernetes manifest and Ignition config files	2091
15.5.15. Preparing the bootstrap Ignition files	2092
15.5.16. Creating control plane Ignition config files on RHOSP	2095
15.5.17. Creating network resources on RHOSP	2096
15.5.17.1. Deploying a cluster with bare metal machines	2097
15.5.18. Creating the bootstrap machine on RHOSP	2099

---

15.5.19. Creating the control plane machines on RHOSP	2099
15.5.20. Logging in to the cluster by using the CLI	2100
15.5.21. Deleting bootstrap resources from RHOSP	2101
15.5.22. Creating compute machines on RHOSP	2101
15.5.23. Approving the certificate signing requests for your machines	2102
15.5.24. Verifying a successful installation	2105
15.5.25. Telemetry access for OpenShift Container Platform	2105
15.5.26. Next steps	2105
15.6. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR ON YOUR OWN INFRASTRUCTURE	2105
15.6.1. Prerequisites	2106
15.6.2. About Kuryr SDN	2106
15.6.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr	2107
15.6.3.1. Increasing quota	2109
15.6.3.2. Configuring Neutron	2109
15.6.3.3. Configuring Octavia	2109
15.6.3.3.1. The Octavia OVN Driver	2112
15.6.3.4. Known limitations of installing with Kuryr	2113
RHOSP general limitations	2113
RHOSP version limitations	2113
RHOSP environment limitations	2114
RHOSP upgrade limitations	2114
15.6.3.5. Control plane machines	2115
15.6.3.6. Compute machines	2115
15.6.3.7. Bootstrap machine	2115
15.6.4. Internet access for OpenShift Container Platform	2116
15.6.5. Downloading playbook dependencies	2116
15.6.6. Downloading the installation playbooks	2117
15.6.7. Obtaining the installation program	2118
15.6.8. Generating a key pair for cluster node SSH access	2119
15.6.9. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	2120
15.6.10. Verifying external network access	2122
15.6.11. Enabling access to the environment	2122
15.6.11.1. Enabling access with floating IP addresses	2122
15.6.11.2. Completing installation without floating IP addresses	2124
15.6.12. Defining parameters for the installation program	2124
15.6.13. Creating the installation configuration file	2126
15.6.14. Installation configuration parameters	2127
15.6.14.1. Required configuration parameters	2127
15.6.14.2. Network configuration parameters	2129
15.6.14.3. Optional configuration parameters	2130
15.6.14.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2135
15.6.14.5. Optional RHOSP configuration parameters	2136
15.6.14.6. Custom subnets in RHOSP deployments	2140
15.6.14.7. Sample customized install-config.yaml file for RHOSP with Kuryr	2141
15.6.14.8. Cluster deployment on RHOSP provider networks	2142
15.6.14.8.1. RHOSP provider network requirements for cluster installation	2143
15.6.14.8.2. Deploying a cluster that has a primary interface on a provider network	2144
15.6.14.9. Kuryr ports pools	2145
15.6.14.10. Adjusting Kuryr ports pools during installation	2146
15.6.14.11. Setting a custom subnet for machines	2147
15.6.14.12. Emptying compute machine pools	2148
15.6.14.13. Modifying the network type	2149
15.6.15. Creating the Kubernetes manifest and Ignition config files	2149

---

15.6.16. Preparing the bootstrap Ignition files	2151
15.6.17. Creating control plane Ignition config files on RHOSP	2154
15.6.18. Creating network resources on RHOSP	2154
15.6.19. Creating the bootstrap machine on RHOSP	2156
15.6.20. Creating the control plane machines on RHOSP	2157
15.6.21. Logging in to the cluster by using the CLI	2157
15.6.22. Deleting bootstrap resources from RHOSP	2158
15.6.23. Creating compute machines on RHOSP	2159
15.6.24. Approving the certificate signing requests for your machines	2159
15.6.25. Verifying a successful installation	2162
15.6.26. Telemetry access for OpenShift Container Platform	2162
15.6.27. Next steps	2163
15.7. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN SR-IOV INFRASTRUCTURE	2163
15.7.1. Prerequisites	2163
15.7.2. Internet access for OpenShift Container Platform	2164
15.7.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	2164
15.7.3.1. Control plane machines	2165
15.7.3.2. Compute machines	2165
15.7.3.3. Bootstrap machine	2166
15.7.4. Downloading playbook dependencies	2166
15.7.5. Downloading the installation playbooks	2167
15.7.6. Obtaining the installation program	2168
15.7.7. Generating a key pair for cluster node SSH access	2169
15.7.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	2171
15.7.9. Verifying external network access	2172
15.7.10. Enabling access to the environment	2173
15.7.10.1. Enabling access with floating IP addresses	2173
15.7.10.2. Completing installation without floating IP addresses	2174
15.7.11. Defining parameters for the installation program	2175
15.7.12. Creating the installation configuration file	2176
15.7.13. Installation configuration parameters	2178
15.7.13.1. Required configuration parameters	2178
15.7.13.2. Network configuration parameters	2179
15.7.13.3. Optional configuration parameters	2181
15.7.13.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2186
15.7.13.5. Optional RHOSP configuration parameters	2187
15.7.13.6. Sample customized install-config.yaml file for RHOSP	2191
15.7.13.7. Custom subnets in RHOSP deployments	2192
15.7.13.8. Setting a custom subnet for machines	2192
15.7.13.9. Emptying compute machine pools	2193
15.7.14. Creating the Kubernetes manifest and Ignition config files	2194
15.7.15. Preparing the bootstrap Ignition files	2195
15.7.16. Creating control plane Ignition config files on RHOSP	2198
15.7.17. Creating network resources on RHOSP	2199
15.7.17.1. Deploying a cluster with bare metal machines	2200
15.7.18. Creating the bootstrap machine on RHOSP	2202
15.7.19. Creating the control plane machines on RHOSP	2202
15.7.20. Logging in to the cluster by using the CLI	2203
15.7.21. Deleting bootstrap resources from RHOSP	2204
15.7.22. Creating SR-IOV networks for compute machines	2204
15.7.23. Creating compute machines that run on SR-IOV networks	2205
15.7.24. Approving the certificate signing requests for your machines	2208
15.7.25. Verifying a successful installation	2211

---

15.7.26. Preparing a cluster that runs on RHOSP for SR-IOV	2212
15.7.26.1. Enabling the RHOSP metadata service as a mountable drive	2212
15.7.26.2. Enabling the No-IOMMU feature for the RHOSP VFIO driver	2213
15.7.27. Telemetry access for OpenShift Container Platform	2214
15.7.28. Additional resources	2214
15.7.29. Next steps	2214
15.8. INSTALLING A CLUSTER ON OPENSTACK IN A RESTRICTED NETWORK	2214
15.8.1. Prerequisites	2214
15.8.2. About installations in restricted networks	2215
15.8.2.1. Additional limits	2215
15.8.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	2215
15.8.3.1. Control plane machines	2216
15.8.3.2. Compute machines	2217
15.8.3.3. Bootstrap machine	2217
15.8.4. Internet access for OpenShift Container Platform	2217
15.8.5. Enabling Swift on RHOSP	2218
15.8.6. Defining parameters for the installation program	2218
15.8.7. Setting cloud provider options	2220
15.8.8. Creating the RHCOS image for restricted network installations	2221
15.8.9. Creating the installation configuration file	2222
15.8.9.1. Configuring the cluster-wide proxy during installation	2224
15.8.9.2. Installation configuration parameters	2226
15.8.9.2.1. Required configuration parameters	2226
15.8.9.2.2. Network configuration parameters	2228
15.8.9.2.3. Optional configuration parameters	2230
15.8.9.2.4. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	2234
15.8.9.2.5. Optional RHOSP configuration parameters	2235
15.8.9.3. Sample customized install-config.yaml file for restricted OpenStack installations	2239
15.8.10. Setting compute machine affinity	2240
15.8.11. Generating a key pair for cluster node SSH access	2242
15.8.12. Enabling access to the environment	2244
15.8.12.1. Enabling access with floating IP addresses	2244
15.8.12.2. Completing installation without floating IP addresses	2245
15.8.13. Deploying the cluster	2246
15.8.14. Verifying cluster status	2247
15.8.15. Logging in to the cluster by using the CLI	2248
15.8.16. Disabling the default OperatorHub sources	2249
15.8.17. Telemetry access for OpenShift Container Platform	2249
15.8.18. Next steps	2249
15.9. OPENSTACK CLOUD CONFIGURATION REFERENCE GUIDE	2249
15.9.1. OpenStack cloud provider options	2250
15.9.1.1. Global options	2250
15.9.1.2. Load balancer options	2251
15.9.1.3. Metadata options	2253
15.10. UNINSTALLING A CLUSTER ON OPENSTACK	2253
15.10.1. Removing a cluster that uses installer-provisioned infrastructure	2253
15.11. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE	2254
15.11.1. Downloading playbook dependencies	2254
15.11.2. Removing a cluster from RHOSP that uses your own infrastructure	2255
<b>CHAPTER 16. INSTALLING ON RHV</b> .....	<b>2256</b>
16.1. PREPARING TO INSTALL ON RED HAT VIRTUALIZATION (RHV)	2256
16.1.1. Prerequisites	2256

16.1.2. Choosing a method to install OpenShift Container Platform on RHV	2256
16.1.2.1. Installing a cluster on installer-provisioned infrastructure	2256
16.1.2.2. Installing a cluster on user-provisioned infrastructure	2256
16.2. INSTALLING A CLUSTER QUICKLY ON RHV	2257
16.2.1. Prerequisites	2257
16.2.2. Internet access for OpenShift Container Platform	2258
16.2.3. Requirements for the RHV environment	2258
16.2.4. Verifying the requirements for the RHV environment	2260
16.2.5. Preparing the network environment on RHV	2262
16.2.6. Installing OpenShift Container Platform on RHV in insecure mode	2262
16.2.7. Generating a key pair for cluster node SSH access	2263
16.2.8. Obtaining the installation program	2265
16.2.9. Deploying the cluster	2266
16.2.10. Installing the OpenShift CLI by downloading the binary	2268
Installing the OpenShift CLI on Linux	2269
Installing the OpenShift CLI on Windows	2269
Installing the OpenShift CLI on macOS	2270
16.2.11. Logging in to the cluster by using the CLI	2270
16.2.12. Verifying cluster status	2271
16.2.13. Accessing the OpenShift Container Platform web console on RHV	2271
16.2.14. Telemetry access for OpenShift Container Platform	2272
16.2.15. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)	2272
16.2.15.1. CPU load increases and nodes go into a Not Ready state	2272
16.2.15.2. Trouble connecting the OpenShift Container Platform cluster API	2273
16.2.16. Post-installation tasks	2273
16.3. INSTALLING A CLUSTER ON RHV WITH CUSTOMIZATIONS	2273
16.3.1. Prerequisites	2274
16.3.2. Internet access for OpenShift Container Platform	2275
16.3.3. Requirements for the RHV environment	2275
16.3.4. Verifying the requirements for the RHV environment	2277
16.3.5. Preparing the network environment on RHV	2279
16.3.6. Installing OpenShift Container Platform on RHV in insecure mode	2279
16.3.7. Generating a key pair for cluster node SSH access	2280
16.3.8. Obtaining the installation program	2282
16.3.9. Creating the installation configuration file	2283
16.3.9.1. Example install-config.yaml files for Red Hat Virtualization (RHV)	2285
Example default install-config.yaml file	2286
Example minimal install-config.yaml file	2286
Example Custom machine pools in an install-config.yaml file	2287
Example non-enforcing affinity group	2287
Example removing all affinity groups for a non-production lab setup	2288
16.3.9.2. Installation configuration parameters	2289
16.3.9.2.1. Required configuration parameters	2289
16.3.9.2.2. Network configuration parameters	2290
16.3.9.2.3. Optional configuration parameters	2292
16.3.9.2.4. Additional Red Hat Virtualization (RHV) configuration parameters	2297
16.3.9.2.5. Additional RHV parameters for machine pools	2298
16.3.10. Deploying the cluster	2302
16.3.11. Installing the OpenShift CLI by downloading the binary	2303
Installing the OpenShift CLI on Linux	2303
Installing the OpenShift CLI on Windows	2304
Installing the OpenShift CLI on macOS	2304
16.3.12. Logging in to the cluster by using the CLI	2305

16.3.13. Verifying cluster status	2305
16.3.14. Accessing the OpenShift Container Platform web console on RHV	2306
16.3.15. Telemetry access for OpenShift Container Platform	2306
16.3.16. Troubleshooting common issues with installing on Red Hat Virtualization (RHV)	2307
16.3.16.1. CPU load increases and nodes go into a Not Ready state	2307
16.3.16.2. Trouble connecting the OpenShift Container Platform cluster API	2307
16.3.17. Post-installation tasks	2308
16.3.18. Next steps	2308
16.4. INSTALLING A CLUSTER ON RHV WITH USER-PROVISIONED INFRASTRUCTURE	2308
16.4.1. Prerequisites	2309
16.4.2. Internet access for OpenShift Container Platform	2309
16.4.3. Requirements for the RHV environment	2310
16.4.4. Verifying the requirements for the RHV environment	2311
16.4.5. Networking requirements for user-provisioned infrastructure	2313
16.4.5.1. Setting the cluster node hostnames through DHCP	2314
16.4.5.2. Network connectivity requirements	2314
NTP configuration for user-provisioned infrastructure	2316
16.4.6. Setting up the installation machine	2316
16.4.7. Installing OpenShift Container Platform on RHV in insecure mode	2316
16.4.8. Generating a key pair for cluster node SSH access	2317
16.4.9. Obtaining the installation program	2319
16.4.10. Downloading the Ansible playbooks	2320
16.4.11. The inventory.yml file	2320
16.4.12. Specifying the RHCOS image settings	2324
16.4.13. Creating the install config file	2325
16.4.14. Customizing install-config.yaml	2326
16.4.15. Generate manifest files	2327
16.4.16. Making control-plane nodes non-schedulable	2328
16.4.17. Building the Ignition files	2329
16.4.18. Creating templates and virtual machines	2329
16.4.19. Creating the bootstrap machine	2330
16.4.20. Creating the control plane nodes	2331
16.4.21. Verifying cluster status	2331
16.4.22. Removing the bootstrap machine	2332
16.4.23. Creating the worker nodes and completing the installation	2332
16.4.24. Telemetry access for OpenShift Container Platform	2334
16.5. INSTALLING A CLUSTER ON RHV IN A RESTRICTED NETWORK	2334
16.5.1. Prerequisites	2334
16.5.2. About installations in restricted networks	2335
16.5.2.1. Additional limits	2335
16.5.3. Internet access for OpenShift Container Platform	2335
16.5.4. Requirements for the RHV environment	2336
16.5.5. Verifying the requirements for the RHV environment	2337
16.5.6. Networking requirements for user-provisioned infrastructure	2339
16.5.6.1. Setting the cluster node hostnames through DHCP	2340
16.5.6.2. Network connectivity requirements	2340
NTP configuration for user-provisioned infrastructure	2342
16.5.7. User-provisioned DNS requirements	2342
16.5.7.1. Example DNS configuration for user-provisioned clusters	2344
16.5.7.2. Load balancing requirements for user-provisioned infrastructure	2346
16.5.7.2.1. Example load balancer configuration for user-provisioned clusters	2348
16.5.8. Setting up the installation machine	2350
16.5.9. Setting up the CA certificate for RHV	2351

16.5.10. Generating a key pair for cluster node SSH access	2352
16.5.11. Downloading the Ansible playbooks	2353
16.5.12. The inventory.yml file	2354
16.5.13. Specifying the RHCOS image settings	2358
16.5.14. Creating the install config file	2358
16.5.15. Sample install-config.yaml file for RHV	2359
16.5.15.1. Configuring the cluster-wide proxy during installation	2362
16.5.16. Customizing install-config.yaml	2363
16.5.17. Generate manifest files	2364
16.5.18. Making control-plane nodes non-schedulable	2366
16.5.19. Building the Ignition files	2366
16.5.20. Creating templates and virtual machines	2367
16.5.21. Creating the bootstrap machine	2368
16.5.22. Creating the control plane nodes	2368
16.5.23. Verifying cluster status	2369
16.5.24. Removing the bootstrap machine	2369
16.5.25. Creating the worker nodes and completing the installation	2370
16.5.26. Telemetry access for OpenShift Container Platform	2371
16.5.27. Disabling the default OperatorHub sources	2372
16.6. UNINSTALLING A CLUSTER ON RHV	2372
16.6.1. Removing a cluster that uses installer-provisioned infrastructure	2372
16.6.2. Removing a cluster that uses user-provisioned infrastructure	2373
<b>CHAPTER 17. INSTALLING ON VSPHERE</b>	<b>2374</b>
17.1. PREPARING TO INSTALL ON VSPHERE	2374
17.1.1. Prerequisites	2374
17.1.2. Choosing a method to install OpenShift Container Platform on vSphere	2374
17.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2374
17.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2375
17.1.3. VMware vSphere infrastructure requirements	2375
17.1.4. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on vSphere	2376
17.2. INSTALLING A CLUSTER ON VSPHERE	2376
17.2.1. Prerequisites	2377
17.2.2. Internet access for OpenShift Container Platform	2377
17.2.3. VMware vSphere infrastructure requirements	2377
17.2.4. Network connectivity requirements	2379
17.2.5. vCenter requirements	2380
Required vCenter account privileges	2380
Using OpenShift Container Platform with vMotion	2389
Cluster resources	2389
Cluster limits	2389
Networking requirements	2390
Required IP Addresses	2390
DNS records	2390
17.2.6. Generating a key pair for cluster node SSH access	2391
17.2.7. Obtaining the installation program	2392
17.2.8. Adding vCenter root CA certificates to your system trust	2393
17.2.9. Deploying the cluster	2394
17.2.10. Installing the OpenShift CLI by downloading the binary	2397
Installing the OpenShift CLI on Linux	2397
Installing the OpenShift CLI on Windows	2397
Installing the OpenShift CLI on macOS	2398

17.2.11. Logging in to the cluster by using the CLI	2398
17.2.12. Creating registry storage	2399
17.2.12.1. Image registry removed during installation	2399
17.2.12.2. Image registry storage configuration	2399
17.2.12.2.1. Configuring registry storage for VMware vSphere	2399
17.2.12.2.2. Configuring block registry storage for VMware vSphere	2401
17.2.13. Backing up VMware vSphere volumes	2402
17.2.14. Steal clock accounting	2403
17.2.15. Telemetry access for OpenShift Container Platform	2403
17.2.16. Next steps	2403
17.3. INSTALLING A CLUSTER ON VSPHERE WITH CUSTOMIZATIONS	2403
17.3.1. Prerequisites	2403
17.3.2. Internet access for OpenShift Container Platform	2404
17.3.3. VMware vSphere infrastructure requirements	2404
17.3.4. Network connectivity requirements	2405
17.3.5. vCenter requirements	2407
Required vCenter account privileges	2407
Using OpenShift Container Platform with vMotion	2415
Cluster resources	2415
Cluster limits	2416
Networking requirements	2416
Required IP Addresses	2416
DNS records	2416
17.3.6. Generating a key pair for cluster node SSH access	2417
17.3.7. Obtaining the installation program	2419
17.3.8. Adding vCenter root CA certificates to your system trust	2420
17.3.9. Creating the installation configuration file	2420
17.3.9.1. Installation configuration parameters	2422
17.3.9.1.1. Required configuration parameters	2422
17.3.9.1.2. Network configuration parameters	2424
17.3.9.1.3. Optional configuration parameters	2426
17.3.9.1.4. Additional VMware vSphere configuration parameters	2430
17.3.9.1.5. Optional VMware vSphere machine pool configuration parameters	2431
17.3.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2432
17.3.9.3. Configuring the cluster-wide proxy during installation	2433
17.3.10. Deploying the cluster	2435
17.3.11. Installing the OpenShift CLI by downloading the binary	2436
Installing the OpenShift CLI on Linux	2436
Installing the OpenShift CLI on Windows	2437
Installing the OpenShift CLI on macOS	2437
17.3.12. Logging in to the cluster by using the CLI	2438
17.3.13. Creating registry storage	2438
17.3.13.1. Image registry removed during installation	2438
17.3.13.2. Image registry storage configuration	2439
17.3.13.2.1. Configuring registry storage for VMware vSphere	2439
17.3.13.2.2. Configuring block registry storage for VMware vSphere	2440
17.3.14. Backing up VMware vSphere volumes	2442
17.3.15. Steal clock accounting	2442
17.3.16. Telemetry access for OpenShift Container Platform	2442
17.3.17. Next steps	2443
17.4. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS	2443
17.4.1. Prerequisites	2443
17.4.2. Internet access for OpenShift Container Platform	2444

17.4.3. VMware vSphere infrastructure requirements	2444
17.4.4. Network connectivity requirements	2445
17.4.5. vCenter requirements	2446
Required vCenter account privileges	2446
Using OpenShift Container Platform with vMotion	2455
Cluster resources	2455
Cluster limits	2455
Networking requirements	2456
Required IP Addresses	2456
DNS records	2456
17.4.6. Generating a key pair for cluster node SSH access	2457
17.4.7. Obtaining the installation program	2459
17.4.8. Adding vCenter root CA certificates to your system trust	2459
17.4.9. Creating the installation configuration file	2460
17.4.9.1. Installation configuration parameters	2462
17.4.9.1.1. Required configuration parameters	2462
17.4.9.1.2. Network configuration parameters	2464
17.4.9.1.3. Optional configuration parameters	2465
17.4.9.1.4. Additional VMware vSphere configuration parameters	2470
17.4.9.1.5. Optional VMware vSphere machine pool configuration parameters	2471
17.4.9.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2472
17.4.9.3. Configuring the cluster-wide proxy during installation	2473
17.4.10. Network configuration phases	2475
17.4.11. Specifying advanced network configuration	2475
17.4.12. Cluster Network Operator configuration	2477
17.4.12.1. Cluster Network Operator configuration object	2477
defaultNetwork object configuration	2478
Configuration for the OpenShift SDN CNI cluster network provider	2478
Configuration for the OVN-Kubernetes CNI cluster network provider	2480
kubeProxyConfig object configuration	2481
17.4.13. Deploying the cluster	2482
17.4.14. Installing the OpenShift CLI by downloading the binary	2483
Installing the OpenShift CLI on Linux	2483
Installing the OpenShift CLI on Windows	2484
Installing the OpenShift CLI on macOS	2484
17.4.15. Logging in to the cluster by using the CLI	2485
17.4.16. Creating registry storage	2485
17.4.16.1. Image registry removed during installation	2485
17.4.16.2. Image registry storage configuration	2486
17.4.16.2.1. Configuring registry storage for VMware vSphere	2486
17.4.16.2.2. Configuring block registry storage for VMware vSphere	2487
17.4.17. Backing up VMware vSphere volumes	2489
17.4.18. Steal clock accounting	2489
17.4.19. Telemetry access for OpenShift Container Platform	2489
17.4.20. Next steps	2490
17.5. INSTALLING A CLUSTER ON VSPHERE WITH USER-PROVISIONED INFRASTRUCTURE	2490
17.5.1. Prerequisites	2490
17.5.2. Internet access for OpenShift Container Platform	2491
17.5.3. VMware vSphere infrastructure requirements	2491
17.5.4. Requirements for a cluster with user-provisioned infrastructure	2492
17.5.4.1. Required machines for cluster installation	2492
17.5.4.2. Minimum resource requirements for cluster installation	2493
17.5.4.3. Certificate signing requests management	2494

17.5.4.4. Networking requirements for user-provisioned infrastructure	2494
17.5.4.4.1. Setting the cluster node hostnames through DHCP	2495
17.5.4.4.2. Network connectivity requirements	2495
Ethernet adaptor hardware address requirements	2496
NTP configuration for user-provisioned infrastructure	2496
17.5.4.5. User-provisioned DNS requirements	2496
17.5.4.5.1. Example DNS configuration for user-provisioned clusters	2498
17.5.4.6. Load balancing requirements for user-provisioned infrastructure	2500
17.5.4.6.1. Example load balancer configuration for user-provisioned clusters	2502
17.5.5. Preparing the user-provisioned infrastructure	2504
17.5.6. Validating DNS resolution for user-provisioned infrastructure	2506
17.5.7. Generating a key pair for cluster node SSH access	2508
17.5.8. Obtaining the installation program	2510
17.5.9. Manually creating the installation configuration file	2511
17.5.9.1. Sample install-config.yaml file for VMware vSphere	2512
17.5.9.2. Configuring the cluster-wide proxy during installation	2514
17.5.10. Creating the Kubernetes manifest and Ignition config files	2515
17.5.11. Extracting the infrastructure name	2517
17.5.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2518
17.5.13. Adding more compute machines to a cluster in vSphere	2522
17.5.14. Disk partitioning	2523
Creating a separate /var partition	2523
17.5.15. Updating the bootloader using bootupd	2525
17.5.16. Installing the OpenShift CLI by downloading the binary	2527
Installing the OpenShift CLI on Linux	2527
Installing the OpenShift CLI on Windows	2527
Installing the OpenShift CLI on macOS	2528
17.5.17. Waiting for the bootstrap process to complete	2528
17.5.18. Logging in to the cluster by using the CLI	2529
17.5.19. Approving the certificate signing requests for your machines	2530
17.5.20. Initial Operator configuration	2532
17.5.20.1. Image registry removed during installation	2533
17.5.20.2. Image registry storage configuration	2534
17.5.20.2.1. Configuring registry storage for VMware vSphere	2534
17.5.20.2.2. Configuring storage for the image registry in non-production clusters	2535
17.5.20.2.3. Configuring block registry storage for VMware vSphere	2536
17.5.21. Completing installation on user-provisioned infrastructure	2537
17.5.22. Backing up VMware vSphere volumes	2540
17.5.23. Telemetry access for OpenShift Container Platform	2540
17.5.24. Next steps	2540
17.6. INSTALLING A CLUSTER ON VSPHERE WITH NETWORK CUSTOMIZATIONS	2541
17.6.1. Prerequisites	2541
17.6.2. Internet access for OpenShift Container Platform	2541
17.6.3. VMware vSphere infrastructure requirements	2542
17.6.4. Requirements for a cluster with user-provisioned infrastructure	2543
17.6.4.1. Required machines for cluster installation	2543
17.6.4.2. Minimum resource requirements for cluster installation	2544
17.6.4.3. Certificate signing requests management	2545
17.6.4.4. Networking requirements for user-provisioned infrastructure	2545
17.6.4.4.1. Setting the cluster node hostnames through DHCP	2545
17.6.4.4.2. Network connectivity requirements	2546
Ethernet adaptor hardware address requirements	2547
NTP configuration for user-provisioned infrastructure	2547

17.6.4.5. User-provisioned DNS requirements	2547
17.6.4.5.1. Example DNS configuration for user-provisioned clusters	2549
17.6.4.6. Load balancing requirements for user-provisioned infrastructure	2551
17.6.4.6.1. Example load balancer configuration for user-provisioned clusters	2553
17.6.5. Preparing the user-provisioned infrastructure	2555
17.6.6. Validating DNS resolution for user-provisioned infrastructure	2557
17.6.7. Generating a key pair for cluster node SSH access	2559
17.6.8. Obtaining the installation program	2561
17.6.9. Manually creating the installation configuration file	2562
17.6.9.1. Sample install-config.yaml file for VMware vSphere	2563
17.6.9.2. Configuring the cluster-wide proxy during installation	2565
17.6.10. Network configuration phases	2566
17.6.11. Specifying advanced network configuration	2567
17.6.12. Cluster Network Operator configuration	2568
17.6.12.1. Cluster Network Operator configuration object	2568
defaultNetwork object configuration	2569
Configuration for the OpenShift SDN CNI cluster network provider	2570
Configuration for the OVN-Kubernetes CNI cluster network provider	2571
kubeProxyConfig object configuration	2573
17.6.13. Creating the Ignition config files	2574
17.6.14. Extracting the infrastructure name	2575
17.6.15. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2576
17.6.16. Adding more compute machines to a cluster in vSphere	2580
17.6.17. Disk partitioning	2581
Creating a separate /var partition	2581
17.6.18. Updating the bootloader using bootupd	2583
17.6.19. Waiting for the bootstrap process to complete	2585
17.6.20. Logging in to the cluster by using the CLI	2586
17.6.21. Approving the certificate signing requests for your machines	2586
17.6.21.1. Initial Operator configuration	2589
17.6.21.2. Image registry removed during installation	2590
17.6.21.3. Image registry storage configuration	2590
17.6.21.3.1. Configuring block registry storage for VMware vSphere	2591
17.6.22. Completing installation on user-provisioned infrastructure	2592
17.6.23. Backing up VMware vSphere volumes	2594
17.6.24. Telemetry access for OpenShift Container Platform	2595
17.6.25. Next steps	2595
<b>17.7. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK</b>	<b>2595</b>
17.7.1. Prerequisites	2595
17.7.2. About installations in restricted networks	2596
17.7.2.1. Additional limits	2596
17.7.3. Internet access for OpenShift Container Platform	2596
17.7.4. VMware vSphere infrastructure requirements	2597
17.7.5. Network connectivity requirements	2598
17.7.6. vCenter requirements	2599
Required vCenter account privileges	2599
Using OpenShift Container Platform with vMotion	2608
Cluster resources	2608
Cluster limits	2609
Networking requirements	2609
Required IP Addresses	2609
DNS records	2609
17.7.7. Generating a key pair for cluster node SSH access	2610

17.7.8. Adding vCenter root CA certificates to your system trust	2612
17.7.9. Creating the RHCOS image for restricted network installations	2613
17.7.10. Creating the installation configuration file	2613
17.7.10.1. Installation configuration parameters	2616
17.7.10.1.1. Required configuration parameters	2616
17.7.10.1.2. Network configuration parameters	2617
17.7.10.1.3. Optional configuration parameters	2619
17.7.10.1.4. Additional VMware vSphere configuration parameters	2624
17.7.10.1.5. Optional VMware vSphere machine pool configuration parameters	2625
17.7.10.2. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	2626
17.7.10.3. Configuring the cluster-wide proxy during installation	2628
17.7.11. Deploying the cluster	2629
17.7.12. Installing the OpenShift CLI by downloading the binary	2630
Installing the OpenShift CLI on Linux	2631
Installing the OpenShift CLI on Windows	2631
Installing the OpenShift CLI on macOS	2632
17.7.13. Logging in to the cluster by using the CLI	2632
17.7.14. Disabling the default OperatorHub sources	2633
17.7.15. Creating registry storage	2633
17.7.15.1. Image registry removed during installation	2633
17.7.15.2. Image registry storage configuration	2633
17.7.15.2.1. Configuring registry storage for VMware vSphere	2634
17.7.16. Steal clock accounting	2635
17.7.17. Telemetry access for OpenShift Container Platform	2635
17.7.18. Next steps	2636
17.8. INSTALLING A CLUSTER ON VSPHERE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	2636
17.8.1. Prerequisites	2636
17.8.2. About installations in restricted networks	2637
17.8.2.1. Additional limits	2637
17.8.3. Internet access for OpenShift Container Platform	2637
17.8.4. VMware vSphere infrastructure requirements	2638
17.8.5. Requirements for a cluster with user-provisioned infrastructure	2639
17.8.5.1. Required machines for cluster installation	2639
17.8.5.2. Minimum resource requirements for cluster installation	2640
17.8.5.3. Certificate signing requests management	2641
17.8.5.4. Networking requirements for user-provisioned infrastructure	2641
17.8.5.4.1. Setting the cluster node hostnames through DHCP	2642
17.8.5.4.2. Network connectivity requirements	2642
Ethernet adaptor hardware address requirements	2643
NTP configuration for user-provisioned infrastructure	2643
17.8.5.5. User-provisioned DNS requirements	2643
17.8.5.5.1. Example DNS configuration for user-provisioned clusters	2645
17.8.5.6. Load balancing requirements for user-provisioned infrastructure	2648
17.8.5.6.1. Example load balancer configuration for user-provisioned clusters	2650
17.8.6. Preparing the user-provisioned infrastructure	2652
17.8.7. Validating DNS resolution for user-provisioned infrastructure	2653
17.8.8. Generating a key pair for cluster node SSH access	2656
17.8.9. Manually creating the installation configuration file	2657
17.8.9.1. Sample install-config.yaml file for VMware vSphere	2659
17.8.9.2. Configuring the cluster-wide proxy during installation	2661
17.8.10. Creating the Kubernetes manifest and Ignition config files	2662
17.8.11. Configuring chrony time service	2664

17.8.12. Extracting the infrastructure name	2665
17.8.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2666
17.8.14. Adding more compute machines to a cluster in vSphere	2670
17.8.15. Disk partitioning	2671
Creating a separate /var partition	2671
17.8.16. Updating the bootloader using bootupd	2673
17.8.17. Waiting for the bootstrap process to complete	2675
17.8.18. Logging in to the cluster by using the CLI	2676
17.8.19. Approving the certificate signing requests for your machines	2676
17.8.20. Initial Operator configuration	2679
17.8.20.1. Disabling the default OperatorHub sources	2680
17.8.20.2. Image registry storage configuration	2680
17.8.20.2.1. Configuring registry storage for VMware vSphere	2681
17.8.20.2.2. Configuring storage for the image registry in non-production clusters	2682
17.8.20.2.3. Configuring block registry storage for VMware vSphere	2683
17.8.21. Completing installation on user-provisioned infrastructure	2684
17.8.22. Backing up VMware vSphere volumes	2687
17.8.23. Telemetry access for OpenShift Container Platform	2687
17.8.24. Next steps	2687
17.9. UNINSTALLING A CLUSTER ON VSPHERE THAT USES INSTALLER-PROVISIONED INFRASTRUCTURE	2687
17.9.1. Removing a cluster that uses installer-provisioned infrastructure	2688
17.10. USING THE VSPHERE PROBLEM DETECTOR OPERATOR	2688
17.10.1. About the vSphere Problem Detector Operator	2688
17.10.2. Running the vSphere Problem Detector Operator checks	2689
17.10.3. Viewing the events from the vSphere Problem Detector Operator	2690
17.10.4. Viewing the logs from the vSphere Problem Detector Operator	2690
17.10.5. Configuration checks run by the vSphere Problem Detector Operator	2691
17.10.6. About the storage class configuration check	2692
17.10.7. Metrics for the vSphere Problem Detector Operator	2693
17.10.8. Additional resources	2693
<b>CHAPTER 18. INSTALLING ON VMC</b>	<b>2694</b>
18.1. PREPARING TO INSTALL ON VMC	2694
18.1.1. Prerequisites	2694
18.1.2. Choosing a method to install OpenShift Container Platform on VMC	2694
18.1.2.1. Installer-provisioned infrastructure installation of OpenShift Container Platform on VMC	2694
18.1.2.2. User-provisioned infrastructure installation of OpenShift Container Platform on VMC	2695
18.1.3. VMware vSphere infrastructure requirements	2695
18.1.4. Uninstalling an installer-provisioned infrastructure installation of OpenShift Container Platform on VMC	2696
18.2. INSTALLING A CLUSTER ON VMC	2696
18.2.1. Setting up VMC for vSphere	2696
18.2.1.1. VMC Sizer tool	2698
18.2.2. vSphere prerequisites	2699
18.2.3. Internet access for OpenShift Container Platform	2699
18.2.4. VMware vSphere infrastructure requirements	2699
18.2.5. Network connectivity requirements	2700
18.2.6. vCenter requirements	2702
Required vCenter account privileges	2702
Using OpenShift Container Platform with vMotion	2710
Cluster resources	2710
Cluster limits	2711

Networking requirements	2711
Required IP Addresses	2711
DNS records	2711
18.2.7. Generating a key pair for cluster node SSH access	2712
18.2.8. Obtaining the installation program	2714
18.2.9. Adding vCenter root CA certificates to your system trust	2715
18.2.10. Deploying the cluster	2715
18.2.11. Installing the OpenShift CLI by downloading the binary	2718
Installing the OpenShift CLI on Linux	2718
Installing the OpenShift CLI on Windows	2719
Installing the OpenShift CLI on macOS	2719
18.2.12. Logging in to the cluster by using the CLI	2720
18.2.13. Creating registry storage	2720
18.2.13.1. Image registry removed during installation	2720
18.2.13.2. Image registry storage configuration	2721
18.2.13.2.1. Configuring registry storage for VMware vSphere	2721
18.2.13.2.2. Configuring block registry storage for VMware vSphere	2722
18.2.14. Backing up VMware vSphere volumes	2724
18.2.15. Steal clock accounting	2724
18.2.16. Telemetry access for OpenShift Container Platform	2724
18.2.17. Next steps	2725
18.3. INSTALLING A CLUSTER ON VMC WITH CUSTOMIZATIONS	2725
18.3.1. Setting up VMC for vSphere	2725
18.3.1.1. VMC Sizer tool	2727
18.3.2. vSphere prerequisites	2727
18.3.3. Internet access for OpenShift Container Platform	2728
18.3.4. VMware vSphere infrastructure requirements	2728
18.3.5. Network connectivity requirements	2729
18.3.6. vCenter requirements	2730
Required vCenter account privileges	2730
Using OpenShift Container Platform with vMotion	2739
Cluster resources	2739
Cluster limits	2740
Networking requirements	2740
Required IP Addresses	2740
DNS records	2740
18.3.7. Generating a key pair for cluster node SSH access	2741

18.7.13. Creating the Ignition config files	2946
18.7.14. Extracting the infrastructure name	2947
18.7.15. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2948
18.7.16. Adding more compute machines to a cluster in vSphere	2952
18.7.17. Disk partitioning	2953
Creating a separate /var partition	2953
18.7.18. Updating the bootloader using bootupd	2955
18.7.19. Waiting for the bootstrap process to complete	2957
18.7.20. Logging in to the cluster by using the CLI	2958
18.7.21. Approving the certificate signing requests for your machines	2958
18.7.22. Initial Operator configuration	2961
18.7.22.1. Image registry removed during installation	2962
18.7.22.2. Image registry storage configuration	2962
18.7.22.2.1. Configuring block registry storage for VMware vSphere	2963
18.7.23. Completing installation on user-provisioned infrastructure	2964
18.7.24. Backing up VMware vSphere volumes	2966
18.7.25. Telemetry access for OpenShift Container Platform	2967
18.7.26. Next steps	2967
18.8. INSTALLING A CLUSTER ON VMC IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	2967
18.8.1. Setting up VMC for vSphere	2967
18.8.1.1. VMC Sizer tool	2969
18.8.2. vSphere prerequisites	2970
18.8.3. About installations in restricted networks	2970
18.8.3.1. Additional limits	2970
18.8.4. Internet access for OpenShift Container Platform	2971
18.8.5. VMware vSphere infrastructure requirements	2971

18.8.6. Requirements for a cluster with user-provisioned infrastructure	2972
18.8.6.1. Required machines for cluster installation	2972
18.8.6.2. Minimum resource requirements for cluster installation	2973
18.8.6.3. Certificate signing requests management	2974
18.8.6.4. Networking requirements for user-provisioned infrastructure	2974
18.8.6.4.1. Setting the cluster node hostnames through DHCP	2974
18.8.6.4.2. Network connectivity requirements	2975
NTP configuration for user-provisioned infrastructure	2976
18.8.6.5. User-provisioned DNS requirements	2976
18.8.6.5.1. Example DNS configuration for user-provisioned clusters	2978
18.8.6.6. Load balancing requirements for user-provisioned infrastructure	2980
18.8.6.6.1. Example load balancer configuration for user-provisioned clusters	2982
18.8.7. Preparing the user-provisioned infrastructure	2984
18.8.8. Validating DNS resolution for user-provisioned infrastructure	2986
18.8.9. Generating a key pair for cluster node SSH access	2988
18.8.10. Manually creating the installation configuration file	2990
18.8.10.1. Sample install-config.yaml file for VMware vSphere	2991
18.8.10.2. Configuring the cluster-wide proxy during installation	2993
18.8.11. Creating the Kubernetes manifest and Ignition config files	2995
18.8.12. Extracting the infrastructure name	2996
18.8.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2997
18.8.14. Adding more compute machines to a cluster in vSphere	3001
18.8.15. Disk partitioning	3002
Creating a separate /var partition	3003
18.8.16. Updating the bootloader using bootupd	3005
18.8.17. Waiting for the bootstrap process to complete	3006
18.8.18. Logging in to the cluster by using the CLI	3007
18.8.19. Approving the certificate signing requests for your machines	3007
18.8.20. Initial Operator configuration	3010
18.8.20.1. Disabling the default OperatorHub sources	3011
18.8.20.2. Image registry storage configuration	3011
18.8.20.2.1. Configuring registry storage for VMware vSphere	3012
18.8.20.2.2. Configuring storage for the image registry in non-production clusters	3013
18.8.20.2.3. Configuring block registry storage for VMware vSphere	3014
18.8.21. Completing installation on user-provisioned infrastructure	3015
18.8.22. Backing up VMware vSphere volumes	3018
18.8.23. Telemetry access for OpenShift Container Platform	3018
18.8.24. Next steps	3018
18.9. UNINSTALLING A CLUSTER ON VMC	3019
18.9.1. Removing a cluster that uses installer-provisioned infrastructure	3019
<b>CHAPTER 19. INSTALLING ON ANY PLATFORM</b> .....	<b>3020</b>
19.1. INSTALLING A CLUSTER ON ANY PLATFORM	3020
19.1.1. Prerequisites	3020
19.1.2. Internet access for OpenShift Container Platform	3020
19.1.3. Requirements for a cluster with user-provisioned infrastructure	3020
19.1.3.1. Required machines for cluster installation	3021
19.1.3.2. Minimum resource requirements for cluster installation	3021
19.1.3.3. Certificate signing requests management	3022
19.1.3.4. Networking requirements for user-provisioned infrastructure	3022
19.1.3.4.1. Setting the cluster node hostnames through DHCP	3023
19.1.3.4.2. Network connectivity requirements	3023
NTP configuration for user-provisioned infrastructure	3024

19.1.3.5. User-provisioned DNS requirements	3024
19.1.3.5.1. Example DNS configuration for user-provisioned clusters	3026
19.1.3.6. Load balancing requirements for user-provisioned infrastructure	3028
19.1.3.6.1. Example load balancer configuration for user-provisioned clusters	3030
19.1.4. Preparing the user-provisioned infrastructure	3032
19.1.5. Validating DNS resolution for user-provisioned infrastructure	3034
19.1.6. Generating a key pair for cluster node SSH access	3036
19.1.7. Obtaining the installation program	3038
19.1.8. Installing the OpenShift CLI by downloading the binary	3039
Installing the OpenShift CLI on Linux	3039
Installing the OpenShift CLI on Windows	3039
Installing the OpenShift CLI on macOS	3040
19.1.9. Manually creating the installation configuration file	3040
19.1.9.1. Sample install-config.yaml file for other platforms	3041
19.1.9.2. Configuring the cluster-wide proxy during installation	3044
19.1.9.3. Configuring a three-node cluster	3045
19.1.10. Creating the Kubernetes manifest and Ignition config files	3046
19.1.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	3048
19.1.11.1. Installing RHCOS by using an ISO image	3049
19.1.11.2. Installing RHCOS by using PXE or iPXE booting	3052
19.1.11.3. Advanced RHCOS installation configuration	3056
19.1.11.3.1. Using advanced networking options for PXE and ISO installations	3056
19.1.11.3.2. Disk partitioning	3057
19.1.11.3.2.1. Creating a separate /var partition	3058
19.1.11.3.2.2. Retaining existing partitions	3060
19.1.11.3.3. Identifying Ignition configs	3061
19.1.11.3.3.1. Embedding a live install Ignition config in the RHCOS ISO	3061
19.1.11.3.4. Advanced RHCOS installation reference	3062
19.1.11.3.4.1. Networking and bonding options for ISO installations	3062
Configuring DHCP or static IP addresses	3063
Configuring an IP address without a static hostname	3064
Specifying multiple network interfaces	3064
Configuring default gateway and route	3064
Disabling DHCP on a single interface	3064
Combining DHCP and static IP configurations	3065
Configuring VLANs on individual interfaces	3065
Providing multiple DNS servers	3065
Bonding multiple network interfaces to a single interface	3065
Bonding multiple network interfaces to a single interface	3066
Using network teaming	3066
19.1.11.3.4.2. coreos-installer options for ISO installations	3066
19.1.11.3.4.3. coreos.inst boot options for ISO or PXE installations	3069
19.1.11.4. Updating the bootloader using bootupd	3070
19.1.12. Waiting for the bootstrap process to complete	3072
19.1.13. Logging in to the cluster by using the CLI	3073
19.1.14. Approving the certificate signing requests for your machines	3073
19.1.15. Initial Operator configuration	3076
19.1.15.1. Disabling the default OperatorHub sources	3077
19.1.15.2. Image registry removed during installation	3077
19.1.15.3. Image registry storage configuration	3078
19.1.15.3.1. Configuring registry storage for bare metal and other manual installations	3078
19.1.15.3.2. Configuring storage for the image registry in non-production clusters	3080
19.1.15.3.3. Configuring block registry storage	3080

19.1.16. Completing installation on user-provisioned infrastructure	3081
19.1.17. Telemetry access for OpenShift Container Platform	3083
19.1.18. Next steps	3083
<b>CHAPTER 20. INSTALLATION CONFIGURATION</b>	<b>3084</b>
20.1. CUSTOMIZING NODES	3084
20.1.1. Creating machine configs with Butane	3084
20.1.1.1. About Butane	3084
20.1.1.2. Installing Butane	3084
20.1.1.3. Creating a MachineConfig object by using Butane	3085
20.1.2. Adding day-1 kernel arguments	3086
20.1.3. Adding kernel modules to nodes	3087
20.1.3.1. Building and testing the kernel module container	3088
20.1.3.2. Provisioning a kernel module to OpenShift Container Platform	3091
20.1.3.2.1. Provision kernel modules via a MachineConfig object	3091
20.1.4. Encrypting and mirroring disks during installation	3093
20.1.4.1. About disk encryption	3093
20.1.4.1.1. Configuring an encryption threshold	3094
20.1.4.2. About disk mirroring	3095
20.1.4.3. Configuring disk encryption and mirroring	3095
20.1.4.4. Configuring a RAID-enabled data volume	3102
20.1.5. Configuring chrony time service	3105
20.1.6. Additional resources	3106
20.2. CONFIGURING YOUR FIREWALL	3106
20.2.1. Configuring your firewall for OpenShift Container Platform	3106
<b>CHAPTER 21. VALIDATING AN INSTALLATION</b>	<b>3112</b>
21.1. REVIEWING THE INSTALLATION LOG	3112
21.2. VIEWING THE IMAGE PULL SOURCE	3112
21.3. GETTING CLUSTER VERSION, STATUS, AND UPDATE DETAILS	3113
21.4. QUERYING THE STATUS OF THE CLUSTER NODES BY USING THE CLI	3115
21.5. REVIEWING THE CLUSTER STATUS FROM THE OPENSIFT CONTAINER PLATFORM WEB CONSOLE	3115
21.6. REVIEWING THE CLUSTER STATUS FROM RED HAT OPENSIFT CLUSTER MANAGER	3116
21.7. CHECKING CLUSTER RESOURCE AVAILABILITY AND UTILIZATION	3117
21.8. LISTING ALERTS THAT ARE FIRING	3119
21.9. NEXT STEPS	3119
<b>CHAPTER 22. TROUBLESHOOTING INSTALLATION ISSUES</b>	<b>3120</b>
22.1. PREREQUISITES	3120
22.2. GATHERING LOGS FROM A FAILED INSTALLATION	3120
22.3. MANUALLY GATHERING LOGS WITH SSH ACCESS TO YOUR HOST(S)	3121
22.4. MANUALLY GATHERING LOGS WITHOUT SSH ACCESS TO YOUR HOST(S)	3122

# CHAPTER 1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

## 1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

The OpenShift Container Platform installation program offers you flexibility. You can use the installation program to deploy a cluster on infrastructure that the installation program provisions and the cluster maintains or deploy a cluster on infrastructure that you prepare and maintain.

These two basic types of OpenShift Container Platform clusters are frequently called installer-provisioned infrastructure clusters and user-provisioned infrastructure clusters.

Both types of clusters have the following characteristics:

- Highly available infrastructure with no single points of failure is available by default
- Administrators maintain control over what updates are applied and when

You use the same installation program to deploy both types of clusters. The main assets generated by the installation program are the Ignition config files for the bootstrap, master, and worker machines. With these three configurations and correctly configured infrastructure, you can start an OpenShift Container Platform cluster.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installation. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel. The ultimate target is a running cluster. By meeting dependencies instead of running commands, the installation program is able to recognize and use existing components instead of running the commands to create them again.

The following diagram shows a subset of the installation targets and dependencies:

Figure 1.1. OpenShift Container Platform installation targets and dependencies

After installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. It includes the **kubelet**, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.9 cluster must use RHCOS, which includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure the machines. Operating system updates are delivered as an Atomic OSTree repository that is embedded in a container image that is rolled out across the cluster by an Operator. Actual operating system changes are made in-place on each machine as an atomic operation by using rpm-ostree. Together, these technologies enable OpenShift Container Platform to manage the operating system like it manages any other application on the cluster, via in-place upgrades that keep the entire platform up-to-date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its components and machines, including the operating system. Because of this, only the installation program and the Machine Config Operator can change machines. The installation program uses Ignition config files to set the exact state of each machine, and the Machine Config Operator completes more changes to the machines, such as the application of new certificates or keys, after installation.

### 1.1.1. Installation process

When you install an OpenShift Container Platform cluster, you download the installation program from the appropriate [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. This site manages:

- REST API for accounts
- Registry tokens, which are the pull secrets that you use to obtain the required components

- Cluster registration, which associates the cluster identity to your Red Hat account to facilitate the gathering of usage metrics

In OpenShift Container Platform 4.9, the installation program is a Go binary file that performs a series of file transformations on a set of assets. The way you interact with the installation program differs depending on your installation type.

- For clusters with installer-provisioned infrastructure, you delegate the infrastructure bootstrapping and provisioning to the installation program instead of doing it yourself. The installation program creates all of the networking, machines, and operating systems that are required to support the cluster.
- If you provision and manage the infrastructure for your cluster, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.

You use three sets of files during installation: an installation configuration file that is named **install-config.yaml**, Kubernetes manifests, and Ignition config files for your machine types.

### IMPORTANT

It is possible to modify Kubernetes and the Ignition config files that control the underlying RHCOS operating system during installation. However, no validation is available to confirm the suitability of any modifications that you make to these objects. If you modify these objects, you might render your cluster non-functional. Because of this risk, modifying Kubernetes and Ignition config files is not supported unless you are following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are wrapped into Ignition config files. The installation program uses these Ignition config files to create the cluster.

The installation configuration files are all pruned when you run the installation program, so be sure to back up all configuration files that you want to use again.

### IMPORTANT

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

### The installation process with installer-provisioned infrastructure

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.

If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.

With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

### The installation process with user-provisioned infrastructure

You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself, including:

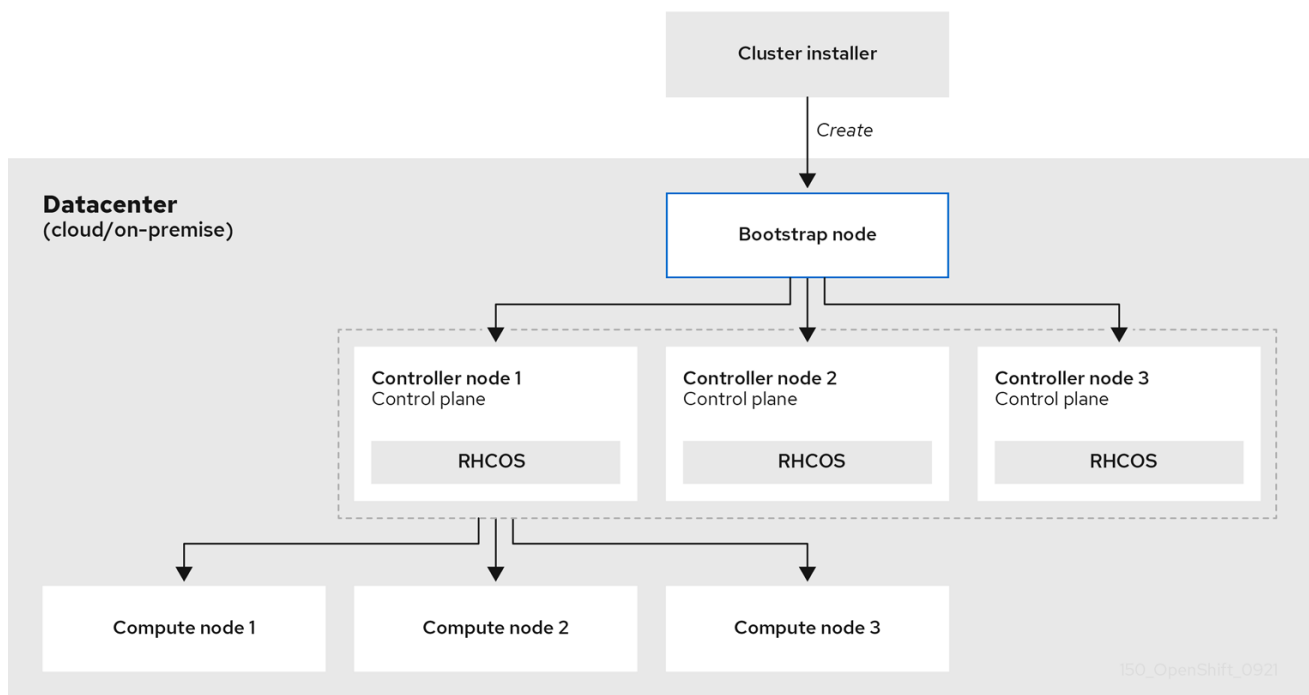

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL compute machines to your cluster.

### Installation process details

Because each machine in the cluster requires information about the cluster when it is provisioned, OpenShift Container Platform uses a temporary *bootstrap* machine during initial configuration to provide the required information to the permanent control plane. It boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:

Figure 1.2. Creating the bootstrap, control plane, and compute machines

After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. (Requires manual intervention if you provision the infrastructure)
2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.
3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. (Requires manual intervention if you provision the infrastructure)
4. The temporary control plane schedules the production control plane to the production control plane machines.
5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.
6. The temporary control plane shuts down and passes control to the production control plane.
7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.
8. The installation program shuts down the bootstrap machine. (Requires manual intervention if you provision the infrastructure)
9. The control plane sets up the compute nodes.
10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operation, including the creation of compute machines in supported environments.

### 1.1.2. Verifying node state after installation

The OpenShift Container Platform installation completes when the following installation health checks are successful:

- The provisioning host can access the OpenShift Container Platform web console.
- All control plane nodes are ready.
- All cluster Operators are available.

## NOTE

After the installation completes, the specific cluster Operators responsible for the worker nodes continuously attempt to provision all worker nodes. It can take some time before all worker nodes report as **READY**. For installations on bare metal, wait a minimum of 60 minutes before troubleshooting a worker node. For installations on all other platforms, wait a minimum of 40 minutes before troubleshooting a worker node. A **DEGRADED** state for the cluster Operators responsible for the worker nodes depends on the Operators' own resources and not on the state of the nodes.

After your installation completes, you can continue to monitor the condition of the nodes in your cluster using the following steps.

## Prerequisites

- The installation program resolves successfully in the terminal.

## Procedure

1. Show the status of all worker nodes:

```
$ oc get nodes
```

### Example output

NAME	STATUS	ROLES	AGE	VERSION
example-compute1.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute2.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute4.example.com	Ready	worker	14m	v1.21.6+bb8d50a
example-control1.example.com	Ready	master	52m	v1.21.6+bb8d50a
example-control2.example.com	Ready	master	55m	v1.21.6+bb8d50a
example-control3.example.com	Ready	master	55m	v1.21.6+bb8d50a

2. Show the phase of all worker machine nodes:

```
$ oc get machines -A
```

### Example output

NAMESPACE	NAME	PHASE	TYPE	REGION	ZONE	AGE
openshift-machine-api	example-zbbt6-master-0	Running				95m
openshift-machine-api	example-zbbt6-master-1	Running				95m
openshift-machine-api	example-zbbt6-master-2	Running				95m
openshift-machine-api	example-zbbt6-worker-0-25bhp	Running				49m

openshift-machine-api	example-zbbt6-worker-0-8b4c2	Running	49m
openshift-machine-api	example-zbbt6-worker-0-jkbqt	Running	49m
openshift-machine-api	example-zbbt6-worker-0-ql5b	Running	49m

### Additional resources

- [Following the installation](#)
- [Validating an installation](#)

### Installation scope

The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

### Additional resources

- See [Available cluster customizations](#) for details about OpenShift Container Platform configuration resources.

## 1.2. SUPPORTED PLATFORMS FOR OPENSIFT CONTAINER PLATFORM CLUSTERS

In OpenShift Container Platform 4.9, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Amazon Web Services (AWS)
- Google Cloud Platform (GCP)
- Microsoft Azure
- Red Hat OpenStack Platform (RHOSP) versions 16.1 and 16.2
  - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the [OpenShift Container Platform on RHOSP support matrix](#).
- Red Hat Virtualization (RHV)
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

## IMPORTANT

After installation, the following changes are not supported:

- Mixing cloud provider platforms
- Mixing cloud provider components, such as using a persistent storage framework from a differing platform than what the cluster is installed on

In OpenShift Container Platform 4.9, you can install a cluster that uses user-provisioned infrastructure on the following platforms:

- AWS
- Azure
- Azure Stack Hub
- GCP
- RHOSP versions 16.1 and 16.2
- RHV
- VMware vSphere
- VMware Cloud on AWS
- Bare metal
- IBM Z or LinuxONE
- IBM Power

Depending on the supported cases for the platform, installations on user-provisioned infrastructure allow you to run machines with full internet access, place your cluster behind a proxy, or perform a *restricted network installation*. In a restricted network installation, you can download the images that are required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a restricted network installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The [OpenShift Container Platform 4.x Tested Integrations](#) page contains details about integration testing for different platforms.

### Additional resources

- See [Supported installation methods for different platforms](#) for more information about the types of installations that are available for each supported platform.
- See [Selecting a cluster installation method and preparing it for users](#) for information about choosing an installation method and preparing the required resources.

## CHAPTER 2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and make sure you that you have all of the required resources to prepare the cluster for users.

### 2.1. SELECTING A CLUSTER INSTALLATION TYPE

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

#### 2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Amazon Web Services (AWS)
- Microsoft Azure
- Microsoft Azure Stack Hub
- Google Cloud Platform (GCP)
- Red Hat OpenStack Platform (RHOSP)
- Red Hat Virtualization (RHV)
- IBM Z and LinuxONE
- IBM Z and LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power
- VMware vSphere
- VMware Cloud (VMC) on AWS
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same datacenter or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use [OpenShift Dedicated](#) or [OpenShift Online](#). You can also use OpenShift as a managed service on Azure, AWS, IBM Cloud, or Google Cloud. For more information about managed services, see the [OpenShift Products](#) page. If you install an OpenShift Container Platform cluster with a cloud virtual machine as a virtual bare metal, the corresponding cloud-based storage is not supported.

#### 2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves the Operators that package, deploy, and manage Kubernetes applications and the operating system that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines as part of the installation process for OpenShift Container Platform. See [Comparing OpenShift Container Platform 3 and OpenShift Container Platform 4](#).

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see [OpenShift Migration Best Practices](#). Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

### 2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called *installer provisioned infrastructure* installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#). These installation methods are the fastest way to deploy a production-capable OpenShift Container Platform cluster.

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#).

For installer-provisioned infrastructure installations, you can use an existing [VPC in AWS](#), [vNet in Azure](#), or [VPC in GCP](#). You can also reuse part of your networking infrastructure so that your cluster in [AWS](#), [Azure](#), [GCP](#), or [VMC on AWS](#) can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for [RHOSP](#), [RHOSP with Kuryr](#), [RHOSP on SR-IOV](#), [RHV](#), [vSphere](#), and [bare metal](#). Additionally, for [vSphere](#), [VMC on AWS](#), you can also customize additional network parameters during installation.

If you want to reuse extensive cloud infrastructure, you can complete a *user-provisioned infrastructure* installation. With these installations, you manually deploy the machines that your cluster requires during the installation process. If you perform a user-provisioned infrastructure installation on [AWS](#), [Azure](#), [Azure Stack Hub](#), [GCP](#), or [VMC on AWS](#), you can use the provided templates to help you stand up all of the required components. You can also reuse a shared [VPC on GCP](#). Otherwise, you can use the [provider-agnostic](#) installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you use [RHOSP](#), [RHOSP on SR-IOV](#), [RHV](#), [IBM Z or LinuxONE](#), [IBM Z or LinuxONE with RHEL KVM](#), [IBM Power](#), or [vSphere](#), use the specific installation instructions to deploy your cluster. If you use other

supported hardware, follow the [bare metal installation](#) procedure. For some of these platforms, such as [RHOSP](#), [vSphere](#), [VMC on AWS](#), and [bare metal](#), you can also customize additional network parameters during installation.

#### 2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The instructions are included in each installation procedure.

If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy a private cluster with installer-provisioned infrastructure on [AWS](#), [Azure](#), or [GCP](#).

If you need to install your cluster that has limited access to the internet, such as a disconnected or restricted network cluster, you can [mirror the installation packages](#) and install the cluster from them. Follow detailed instructions for user provisioned infrastructure installations into restricted networks for [AWS](#), [GCP](#), [IBM Z or LinuxONE](#), [IBM Z or LinuxONE with RHEL KVM](#), [IBM Power](#), [vSphere](#), [VMC on AWS](#), or [bare metal](#). You can also install a cluster into a restricted network using installer-provisioned infrastructure by following detailed instructions for [AWS](#), [GCP](#), [VMC on AWS](#), [RHOSP](#), [RHV](#), and [vSphere](#).

If you need to deploy your cluster to an [AWS GovCloud region](#), [AWS China region](#), or [Azure government region](#), you can configure those custom regions during an installer-provisioned infrastructure installation.

You can also configure the cluster machines to use [FIPS Validated / Modules in Process cryptographic libraries](#) during installation.

#### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

## 2.2. PREPARING YOUR CLUSTER FOR USERS AFTER INSTALLATION

Some configuration is not required to install the cluster but recommended before your users access the cluster. You can customize the cluster itself by [customizing](#) the Operators that make up your cluster and integrate your cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- [Persistent storage](#)
- [An identity provider](#)
- [Monitoring core OpenShift Container Platform components](#)

## 2.3. PREPARING YOUR CLUSTER FOR WORKLOADS

Depending on your workload needs, you might need to take extra steps before you begin deploying applications. For example, after you prepare infrastructure to support your application [build strategy](#), you might need to make provisions for [low-latency](#) workloads or to [protect sensitive workloads](#). You can also configure [monitoring](#) for application workloads. If you plan to run [Windows workloads](#), you must enable [hybrid networking with OVN-Kubernetes](#) during the installation process; hybrid networking cannot be enabled after your cluster is installed.

## 2.4. SUPPORTED INSTALLATION METHODS FOR DIFFERENT PLATFORMS

You can perform different types of installations on different platforms.

### NOTE

Not all installation options are supported for all platforms, as shown in the following tables. A checkmark indicates that the option is supported and links to the relevant section.

Table 2.1. Installer-provisioned infrastructure options

	AWS	Azure	GCP	RHO SP	RHO SP on SR- IOV	RHV	Bare meta l	vSph ere	VMC	IBM Z	IBM Powe r

## CHAPTER 3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

You can use the procedures in this section to ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

### IMPORTANT

You must have access to the internet to obtain the necessary container images. In this procedure, you place your mirror registry on a mirror host that has access to both your network and the Internet. If you do not have access to a mirror host, use the [Mirroring Operator catalogs for use with disconnected clusters](#) procedure to copy images to a device you can move across network boundaries with.

### 3.1. PREREQUISITES

- You must have a container image registry that supports [Docker v2-2](#) in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
  - [Red Hat Quay](#)
  - [JFrog Artifactory](#)
  - [Sonatype Nexus Repository](#)
  - [Harbor](#)

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay [for proof-of-concept purposes](#) or [by using the Quay Operator](#). If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat support.

- If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a [mirror registry for Red Hat OpenShift](#). The *mirror registry for Red Hat OpenShift* is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

### 3.2. ABOUT THE MIRROR REGISTRY

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry such as Red Hat Quay, JFrog Artifactory, Sonatype Nexus Repository, or Harbor. If you do not have access to a large-scale container registry, you can use the *mirror registry for Red Hat OpenShift*, a small-scale container registry included with OpenShift Container Platform subscriptions.

You can use any container registry that supports [Docker v2-2](#), such as Red Hat Quay, the *mirror registry for Red Hat OpenShift*, Artifactory, Sonatype Nexus Repository, or Harbor. Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

### IMPORTANT

The internal registry of the OpenShift Container Platform cluster cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the *mirror registry for Red Hat OpenShift*, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the **crictl images** command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

### NOTE

Red Hat does not test third party registries with OpenShift Container Platform.

### Additional information

For information on viewing the CRI-O logs to view the image source, see [Viewing the image pull source](#).

## 3.3. PREPARING YOUR MIRROR HOST

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.

### 3.3.1. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

## 3.4. CONFIGURING CREDENTIALS THAT ALLOW IMAGES TO BE MIRRORED

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

### WARNING

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

### WARNING

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

### Prerequisites

- You configured a mirror registry to use in your disconnected environment.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

### Procedure

Complete the following steps on the installation host:

1. Download your **registry.redhat.io** [pull secret from the Red Hat OpenShift Cluster Manager](#) and save it to a **.json** file.
2. Generate the base64-encoded user name and password or token for your mirror registry:

```
$ echo -n '<user_name>:<password>' | base64 -w0 1
BGVtbYk3ZHAtdXs=
```

- 1 For **<user\_name>** and **<password>**, specify the user name and password that you configured for your registry.

3. Make a copy of your pull secret in JSON format:

```
$ cat ./pull-secret.text | jq . > <path>/<pull_secret_file_in_json> 1
```

- 1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

4. Save the file either as `~/.docker/config.json` or `$XDG_RUNTIME_DIR/containers/auth.json`. The contents of the file resemble the following example:

```
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

5. Edit the new file and add a section that describes your registry to it:

```
"auths": {
  "<mirror_registry>": { 1
    "auth": "<credentials>", 2
    "email": "you@example.com"
  }
},
```

- 1 For **<mirror\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:8443**

- 2 For **<credentials>**, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{
  "auths": {
    "registry.example.com": {
      "auth": "BGVtbYk3ZHAqXs=",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

### 3.5. MIRROR REGISTRY FOR RED HAT OPENSIFT

The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

If you already have a container image registry, such as Red Hat Quay, you can skip these steps and go straight to [Mirroring the OpenShift Container Platform image repository](#).

#### Prerequisites

- An OpenShift Container Platform subscription.
- Red Hat Enterprise Linux (RHEL) 8 with Podman 3.3 and OpenSSL installed.
- Fully qualified domain name for the Red Hat Quay service, which must resolve through a DNS server.
- Passwordless **sudo** access on the target host.
- Key-based SSH connectivity on the target host. SSH keys are automatically generated for local installs. For remote hosts, you must generate your own SSH keys.
- 2 or more vCPUs.
- 8 GB of RAM.

- About 9.6 GB for OpenShift Container Platform 4.9 Release images, or about 444 GB for OpenShift Container Platform 4.9 Release images and OpenShift Container Platform 4.9 Red Hat Operator images. Up to 1 TB per stream or more is suggested.

## IMPORTANT

These requirements are based on local testing results with only Release images and Operator images tested. Storage requirements can vary based on your organization's needs. Some users might require more space, for example, when they mirror multiple z-streams. You can use standard Red Hat Quay functionality to remove unnecessary images and free up space.

### 3.5.1. Mirror registry for Red Hat OpenShift introduction

For disconnected deployments of OpenShift Container Platform, a container registry is required to carry out the installation of the clusters. To run a production-grade registry service on such a cluster, you must create a separate registry deployment to install the first cluster. The *mirror registry for Red Hat OpenShift* addresses this need and is included in every OpenShift subscription. It is available for download on the [OpenShift console Downloads](#) page.

The *mirror registry for Red Hat OpenShift* allows users to install a small-scale version of Red Hat Quay and its required components using the **mirror-registry** command line interface (CLI) tool. The *mirror registry for Red Hat OpenShift* is deployed automatically with pre-configured local storage and a local database. It also includes auto-generated user credentials and access permissions with a single set of inputs and no additional configuration choices to get started.

The *mirror registry for Red Hat OpenShift* provides a pre-determined network configuration and reports deployed component credentials and access URLs upon success. A limited set of optional configuration inputs like fully qualified domain name (FQDN) services, superuser name and password, and custom TLS certificates are also provided. This provides users with a container registry so that they can easily create an offline mirror of all OpenShift Container Platform release content when running OpenShift Container Platform in restricted network environments.

The *mirror registry for Red Hat OpenShift* is limited to hosting images that are required to install a disconnected OpenShift Container Platform cluster, such as Release images or Red Hat Operator images. It uses local storage on your Red Hat Enterprise Linux (RHEL) machine, and storage supported by RHEL is supported by the *mirror registry for Red Hat OpenShift*. Content built by customers should not be hosted by the *mirror registry for Red Hat OpenShift*.

Unlike Red Hat Quay, the *mirror registry for Red Hat OpenShift* is not a highly-available registry and only local file system storage is supported. Using the *mirror registry for Red Hat OpenShift* with more than one cluster is discouraged, because multiple clusters can create a single point of failure when updating your cluster fleet. It is advised to leverage the *mirror registry for Red Hat OpenShift* to install a cluster that can host a production-grade, highly-available registry such as Red Hat Quay, which can serve OpenShift Container Platform content to other clusters.

Use of the *mirror registry for Red Hat OpenShift* is optional if another container registry is already available in the install environment.

### 3.5.2. Mirroring on a local host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a local host using the **mirror-registry** installer tool. By doing so, users can create a local host registry running on port 443 for the purpose of storing a mirror of OpenShift Container Platform images.

**NOTE**

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **/etc/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

**Procedure**

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ sudo ./mirror-registry install \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the registry by running the following command:

```
$ podman login --authfile pull-secret.txt \
  -u init \
  -p <password> \
  <host_example_com>:8443> \
  --tls-verify=false 1
```

- 1 You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

**NOTE**

You can also log in by accessing the UI at **https://<host.example.com>:8443** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

**3.5.3. Mirroring on a remote host with mirror registry for Red Hat OpenShift**

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a remote host using the **mirror-registry** tool. By doing so, users can create a registry to hold a mirror of OpenShift Container Platform images.

## NOTE

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a `/etc/quay-install` directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

## Procedure

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ sudo ./mirror-registry install -v \
  --targetHostname <host_example_com> \
  --targetUsername <example_user> \
  -k ~/.ssh/my_ssh_key \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the mirror registry by running the following command:

```
$ podman login --authfile pull-secret.txt \
  -u init \
  -p <password> \
  <host_example_com>:8443> \
  --tls-verify=false 1
```

- 1 You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

## NOTE

You can also log in by accessing the UI at **<https://<host.example.com>:8443>** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

## 3.6. UPGRADING THE MIRROR REGISTRY FOR RED HAT OPENSIFT

- You can upgrade the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

```
$ sudo ./mirror-registry upgrade
```

**NOTE**

- Users who upgrade the *mirror registry for Red Hat OpenShift* with the **./mirror-registry upgrade** flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayHostname <host\_example\_com>** and **--quayRoot <example\_directory\_name>**, you must include that string to properly upgrade the mirror registry.

### 3.6.1. Uninstalling the mirror registry for Red Hat OpenShift

- You can uninstall the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

```
$ sudo ./mirror-registry uninstall -v \
  --quayRoot <example_directory_name>
```

**NOTE**

- Deleting the *mirror registry for Red Hat OpenShift* will prompt the user before deletion. You can use **--autoApprove** to skip this prompt.
- Users who install the *mirror registry for Red Hat OpenShift* with the **--quayRoot** flag must include the **--quayRoot** flag when uninstalling. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayRoot example\_directory\_name**, you must include that string to properly uninstall the mirror registry.

### 3.6.2. Mirror registry for Red Hat OpenShift flags

The following flags are available for the *mirror registry for Red Hat OpenShift*:

Flags	Description
<b>--autoApprove</b>	A boolean value that disables interactive prompts. If set to <b>true</b> , the <b>quayRoot</b> directory is automatically deleted when uninstalling the mirror registry. Defaults to <b>false</b> if left unspecified.

Flags	Description
<b>--initPassword</b>	The password of the init user created during Quay installation. Must be at least eight characters and contain no whitespace.
<b>--initUser string</b>	Shows the username of the initial user. Defaults to <b>init</b> if left unspecified.
<b>--quayHostname</b>	The fully-qualified domain name of the mirror registry that clients will use to contact the registry. Equivalent to <b>SERVER_HOSTNAME</b> in the Quay <b>config.yaml</b> . Must resolve by DNS. Defaults to <b>&lt;targetHostname&gt;:8443</b> if left unspecified. <sup>[1]</sup>
<b>--quayRoot, -r</b>	The directory where container image layer and configuration data is saved, including <b>rootCA.key</b> , <b>rootCA.pem</b> , and <b>rootCA.srl</b> certificates. Requires about 9.6 GB for OpenShift Container Platform 4.9 Release images, or about 444 GB for OpenShift Container Platform 4.9 Release images and OpenShift Container Platform 4.9 Red Hat Operator images. Defaults to <b>/etc/quay-install</b> if left unspecified.
<b>--ssh-key, -k</b>	The path of your SSH identity key. Defaults to <b>~/ssh/quay_installer</b> if left unspecified.
<b>--sslCert</b>	The path to the SSL/TLS public key / certificate. Defaults to <b>{quayRoot}/quay-config</b> and is auto-generated if left unspecified.
<b>--sslCheckSkip</b>	Skips the check for the certificate hostname against the <b>SERVER_HOSTNAME</b> in the <b>config.yaml</b> file. <sup>[2]</sup>
<b>--sslKey</b>	The path to the SSL/TLS private key used for HTTPS communication. Defaults to <b>{quayRoot}/quay-config</b> and is auto-generated if left unspecified.
<b>--targetHostname, -H</b>	The hostname of the target you want to install Quay to. Defaults to <b>\$HOST</b> , for example, a local host, if left unspecified.
<b>--targetUsername, -u</b>	The user on the target host which will be used for SSH. Defaults to <b>\$USER</b> , for example, the current user if left unspecified.
<b>--verbose, -v</b>	Shows debug logs and Ansible playbook outputs.
<b>--version</b>	Shows the version for the <i>mirror registry for Red Hat OpenShift</i>

1. **--quayHostname** must be modified if the public DNS name of your system is different from the local hostname.
2. **--sslCheckSkip** is used in cases when the mirror registry is set behind a proxy and the exposed hostname is different from the internal Quay hostname. It can also be used when users do not want the certificates to be validated against the provided Quay hostname during installation.

## Additional resources

- [Using SSL to protect connections to Red Hat Quay](#)
- [Configuring the system to trust the certificate authority](#)
- [Mirroring the OpenShift Container Platform image repository](#)
- [Mirroring Operator catalogs for use with disconnected clusters](#)

## 3.7. MIRRORING THE OPENSIFT CONTAINER PLATFORM IMAGE REPOSITORY

Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

### Prerequisites

- Your mirror host has access to the internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the [pull secret from the Red Hat OpenShift Cluster Manager](#) and modified it to include authentication to your mirror repository.
- If you use self-signed certificates that do not set a Subject Alternative Name, you must precede the **oc** commands in this procedure with **GODEBUG=x509ignoreCN=0**. If you do not set this variable, the **oc** commands will fail with the following error:

```
x509: certificate relies on legacy Common Name field, use SANs or temporarily enable  
Common Name matching with GODEBUG=x509ignoreCN=0
```

### Procedure

Complete the following steps on the mirror host:

1. Review the [OpenShift Container Platform downloads page](#) to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the [Repository Tags](#) page.
2. Set the required environment variables:
  - a. Export the release version:

```
$ OCP_RELEASE=<release_version>
```

For **<release\_version>**, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as **4.5.4**.

- b. Export the local registry name and host port:

```
$ LOCAL_REGISTRY='<local_registry_host_name>:<local_registry_host_port>'
```

For **<local\_registry\_host\_name>**, specify the registry domain name for your mirror repository, and for **<local\_registry\_host\_port>**, specify the port that it serves content on.

- c. Export the local repository name:

```
$ LOCAL_REPOSITORY='<local_repository_name>'
```

For **<local\_repository\_name>**, specify the name of the repository to create in your registry, such as **ocp4/openshift4**.

- d. Export the name of the repository to mirror:

```
$ PRODUCT_REPO='openshift-release-dev'
```

For a production release, you must specify **openshift-release-dev**.

- e. Export the path to your registry pull secret:

```
$ LOCAL_SECRET_JSON='<path_to_pull_secret>'
```

For **<path\_to\_pull\_secret>**, specify the absolute path to and file name of the pull secret for your mirror registry that you created.

- f. Export the release mirror:

```
$ RELEASE_NAME="ocp-release"
```

For a production release, you must specify **ocp-release**.

- g. Export the type of architecture for your server, such as **x86\_64**:

```
$ ARCHITECTURE=<server_architecture>
```

- h. Export the path to the directory to host the mirrored images:

```
$ REMOVABLE_MEDIA_PATH=<path> 1
```

- 1** Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the mirror registry:

- If your mirror host does not have internet access, take the following actions:
  - i. Connect the removable media to a system that is connected to the internet.
  - ii. Review the images and configuration manifests to mirror:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-
  image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE} --dry-run
```

- iii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.
- iv. Mirror the images to a directory on the removable media:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} --to-dir=${REMOVABLE_MEDIA_PATH}/mirror quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE}
```

- v. Take the media to the restricted network environment and upload the images to the local container registry.

```
$ oc image mirror -a ${LOCAL_SECRET_JSON} --from-dir=${REMOVABLE_MEDIA_PATH}/mirror "file://openshift/release:${OCP_RELEASE}*" ${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} 1
```

- 1** For **REMOVABLE\_MEDIA\_PATH**, you must use the same path that you specified when you mirrored the images.

- If the local container registry is connected to the mirror host, take the following actions:
  - i. Directly push the release images to the local registry by using following command:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \ --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-${ARCHITECTURE} \ --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \ --to-release-image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-${ARCHITECTURE}
```

This command pulls the release information as a digest, and its output includes the **imageContentSources** data that you require when you install your cluster.

- ii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.

#### NOTE

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.

4. To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:
  - If your mirror host does not have internet access, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}"
```

- If the local container registry is connected to the mirror host, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
${ARCHITECTURE}"
```

### IMPORTANT

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active internet connection.

If you are in a disconnected environment, use the **--image** flag as part of `must-gather` and point to the payload image.

5. For clusters using installer-provisioned infrastructure, run the following command:

```
$ openshift-install
```

## 3.8. THE CLUSTER SAMPLES OPERATOR IN A DISCONNECTED ENVIRONMENT

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

### 3.8.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named **imagestreamtag-to-image** in the **openshift-cluster-samples-operator** namespace. The **imagestreamtag-to-image** config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is **<image\_stream\_name>\_<image\_stream\_tag\_name>**.

During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to **Removed**. If you choose to change it to **Managed**, it installs samples.

### NOTE

The use of samples in a network-restricted or discontinued environment may require access to services external to your network. Some example services include: Github, Maven Central, npm, RubyGems, PyPi and others. There might be additional steps to take that allow the cluster samples operators's objects to reach the services they require.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to **Removed**, you can create your mirrored registry, or determine which existing mirrored registry you want to use.
- Mirror the samples you want to the mirrored registry using the new config map as your guide.
- Add any of the image streams you did not mirror to the **skippedImagestreams** list of the Cluster Samples Operator configuration object.
- Set **samplesRegistry** of the Cluster Samples Operator configuration object to the mirrored registry.
- Then set the Cluster Samples Operator to **Managed** to install the image streams you have mirrored.

## 3.9. MIRRORING OPERATOR CATALOGS FOR USE WITH DISCONNECTED CLUSTERS

You can mirror the Operator contents of a Red Hat-provided catalog, or a custom catalog, into a container image registry using the **oc adm catalog mirror** command. The target registry must support [Docker v2-2](#). For a cluster on a restricted network, this registry can be one that the cluster has network access to, such as a mirror registry created during a restricted network cluster installation.

### IMPORTANT

The internal registry of the OpenShift Container Platform cluster cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

The **oc adm catalog mirror** command also automatically mirrors the index image that is specified during the mirroring process, whether it be a Red Hat-provided index image or your own custom-built index image, to the target registry. You can then use the mirrored index image to create a catalog source that allows Operator Lifecycle Manager (OLM) to load the mirrored catalog onto your OpenShift Container Platform cluster.

### Additional resources

- [Using Operator Lifecycle Manager on restricted networks](#)

### 3.9.1. Prerequisites

Mirroring Operator catalogs for use with disconnected clusters has the following prerequisites:

- Workstation with unrestricted network access.
- **podman** version 1.9.3 or later.
- If you want to filter, or *prune*, the default catalog and selectively mirror only a subset of Operators, see the following sections:
  - [Installing the opm CLI](#)
  - [Filtering a SQLite-based index image](#)
- If you want to mirror a Red Hat-provided catalog, run the following command on your workstation with unrestricted network access to authenticate with **registry.redhat.io**:

```
$ podman login registry.redhat.io
```

- Access to a mirror registry that supports [Docker v2-2](#).
- On your mirror registry, decide which namespace to use for storing mirrored Operator content. For example, you might create an **olm-mirror** namespace.
- If your mirror registry does not have internet access, connect removable media to your workstation with unrestricted network access.
- If you are working with private registries, including **registry.redhat.io**, set the **REG\_CREDS** environment variable to the file path of your registry credentials for use in later steps. For example, for the **podman** CLI:

```
$ REG_CREDS=${XDG_RUNTIME_DIR}/containers/auth.json
```

### 3.9.2. Extracting and mirroring catalog contents

The **oc adm catalog mirror** command extracts the contents of an index image to generate the manifests required for mirroring. The default behavior of the command generates manifests, then automatically mirrors all of the image content from the index image, as well as the index image itself, to your mirror registry.

Alternatively, if your mirror registry is on a completely disconnected, or *airgapped*, host, you can first mirror the content to removable media, move the media to the disconnected environment, then mirror the content from the media to the registry.

#### 3.9.2.1. Mirroring catalog contents to registries on the same network

If your mirror registry is co-located on the same network as your workstation with unrestricted network access, take the following actions on your workstation.

##### Procedure

1. If your mirror registry requires authentication, run the following command to log in to the registry:

```
$ podman login <mirror_registry>
```

2. Run the following command to extract and mirror the content to the mirror registry:

```
$ oc adm catalog mirror \
  <index_image> \ 1
  <mirror_registry>:<port>/<namespace> \ 2
  [-a ${REG_CREDS}] \ 3
  [--insecure] \ 4
  [--index-filter-by-os='<platform>/<arch>'] \ 5
  [--manifests-only] 6
```

- 1** Specify the index image for the catalog that you want to mirror. For example, this might be a pruned index image that you created previously, or one of the source index images for the default catalogs, such as **registry.redhat.io/redhat/redhat-operator-index:v4.9**.

- 2 Specify the fully qualified domain name (FQDN) for the target registry and namespace to mirror the Operator contents to, where **<namespace>** is any existing namespace on the registry. For example, you might create an **olm-mirror** namespace to push all mirrored content to.
- 3 Optional: If required, specify the location of your registry credentials file. **{REG\_CREDS}** is required for **registry.redhat.io**.
- 4 Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5 Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are passed as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, and **.\***
- 6 Optional: Generate only the manifests required for mirroring, and do not actually mirror the image content to a registry. This option can be useful for reviewing what will be mirrored, and it allows you to make any changes to the mapping list if you require only a subset of packages. You can then use the **mapping.txt** file with the **oc image mirror** command to mirror the modified list of images in a later step. This flag is intended for only advanced selective mirroring of content from the catalog; the **opm index prune** command, if you used it previously to prune the index image, is suitable for most catalog management use cases.

### Example output

```
src image has index label for database path: /database/index.db
using database path mapping: /database/index.db:/tmp/153048078
wrote database to /tmp/153048078 1
...
wrote mirroring manifests to manifests-redhat-operator-index-1614211642 2
```

- 1 Directory for the temporary **index.db** database generated by the command.
- 2 Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.

### NOTE

Red Hat Quay does not support nested repositories. As a result, running the **oc adm catalog mirror** command will fail with a **401** unauthorized error. As a workaround, you can use the **--max-components=2** option when running the **oc adm catalog mirror** command to disable the creation of nested repositories. For more information on this workaround, see the [Unauthorized error thrown while using catalog mirror command with Quay registry](#) Knowledgebase Solution.

### Additional resources

- [Architecture and operating system support for Operators](#)

### 3.9.2.2. Mirroring catalog contents to airgapped registries

If your mirror registry is on a completely disconnected, or airgapped, host, take the following actions.

## Procedure

1. Run the following command on your workstation with unrestricted network access to mirror the content to local files:

```
$ oc adm catalog mirror \  
  <index_image> \ 1  
  file:///local/index \ 2  
  -a ${REG_CREDS} \ 3  
  --insecure \ 4  
  --index-filter-by-os='<platform>/<arch>' 5
```

- 1** Specify the index image for the catalog that you want to mirror. For example, this might be a pruned index image that you created previously, or one of the source index images for the default catalogs, such as **registry.redhat.io/redhat/redhat-operator-index:v4.9**.
- 2** Specify the content to mirror to local files in your current directory.
- 3** Optional: If required, specify the location of your registry credentials file.
- 4** Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5** Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, and **.\***

## Example output

```
...  
info: Mirroring completed in 5.93s (5.915MB/s)  
wrote mirroring manifests to manifests-my-index-1614985528 1
```

To upload local images to a registry, run:

```
oc adm catalog mirror file:///local/index/myrepo/my-index:v1 REGISTRY/REPOSITORY 2
```

- 1** Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.
- 2** Record the expanded **file://** path that is based on your provided index image. This path is referenced in a subsequent step.

This command creates a **v2/** directory in your current directory.

2. Copy the **v2/** directory to removable media.
3. Physically remove the media and attach it to a host in the disconnected environment that has access to the mirror registry.

- If your mirror registry requires authentication, run the following command on your host in the disconnected environment to log in to the registry:

```
$ podman login <mirror_registry>
```

- Run the following command from the parent directory containing the **v2/** directory to upload the images from local files to the mirror registry:

```
$ oc adm catalog mirror \
  file://local/index/<repo>/<index_image>:<tag> \ 1
  <mirror_registry>:<port>/<namespace> \ 2
  -a ${REG_CREDS} \ 3
  --insecure \ 4
  --index-filter-by-os='<platform>/<arch>' 5
```

- Specify the **file://** path from the previous command output.
- Specify the fully qualified domain name (FQDN) for the target registry and namespace to mirror the Operator contents to, where **<namespace>** is any existing namespace on the registry. For example, you might create an **olm-mirror** namespace to push all mirrored content to.
- Optional: If required, specify the location of your registry credentials file.
- Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '**<platform>/<arch>/<variant>**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, and **.\***

## NOTE

Red Hat Quay does not support nested repositories. As a result, running the **oc adm catalog mirror** command will fail with a **401** unauthorized error. As a workaround, you can use the **--max-components=2** option when running the **oc adm catalog mirror** command to disable the creation of nested repositories. For more information on this workaround, see the [Unauthorized error thrown while using catalog mirror command with Quay registry](#) Knowledgebase Solution.

- Run the **oc adm catalog mirror** command again. Use the newly mirrored index image as the source and the same mirror registry namespace used in the previous step as the target:

```
$ oc adm catalog mirror \
  <mirror_registry>:<port>/<index_image> \
  <mirror_registry>:<port>/<namespace> \
  --manifests-only 1
  [-a ${REG_CREDS}] \
  [--insecure]
```

- The **--manifests-only** flag is required for this step so that the command does not copy all of the mirrored content again.

## IMPORTANT

This step is required because the image mappings in the **imageContentSourcePolicy.yaml** file generated during the previous step must be updated from local paths to valid mirror locations. Failure to do so will cause errors when you create the **ImageContentSourcePolicy** object in a later step.

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the **ImageContentSourcePolicy** and **CatalogSource** objects. These objects are required to enable installation of Operators from OperatorHub.

### Additional resources

- [Architecture and operating system support for Operators](#)

### 3.9.3. Generated manifests

After mirroring Operator catalog content to your mirror registry, a manifests directory is generated in your current directory.

If you mirrored content to a registry on the same network, the directory name takes the following pattern:

```
manifests-<index_image_name>-<random_number>
```

If you mirrored content to a registry on a disconnected host in the previous section, the directory name takes the following pattern:

```
manifests-index/<namespace>/<index_image_name>-<random_number>
```

## NOTE

The manifests directory name is referenced in subsequent procedures.

The manifests directory contains the following files, some of which might require further modification:

- The **catalogSource.yaml** file is a basic definition for a **CatalogSource** object that is pre-populated with your index image tag and other relevant metadata. This file can be used as is or modified to add the catalog source to your cluster.

## IMPORTANT

If you mirrored the content to local files, you must modify your **catalogSource.yaml** file to remove any backslash (`/`) characters from the **metadata.name** field. Otherwise, when you attempt to create the object, it fails with an "invalid resource name" error.

- The **imageContentSourcePolicy.yaml** file defines an **ImageContentSourcePolicy** object that can configure nodes to translate between the image references stored in Operator manifests and the mirrored registry.

## NOTE

If your cluster uses an **ImageContentSourcePolicy** object to configure repository mirroring, you can use only global pull secrets for mirrored registries. You cannot add a pull secret to a project.

- The **mapping.txt** file contains all of the source images and where to map them in the target registry. This file is compatible with the **oc image mirror** command and can be used to further customize the mirroring configuration.

## IMPORTANT

If you used the **--manifests-only** flag during the mirroring process and want to further trim the subset of packages to mirror, see the steps in the [Mirroring a package manifest format catalog image](#) procedure of the OpenShift Container Platform 4.7 documentation about modifying your **mapping.txt** file and using the file with the **oc image mirror** command.

### 3.9.4. Post-installation requirements

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the **ImageContentSourcePolicy** and **CatalogSource** objects. These objects are required to populate and enable installation of Operators from OperatorHub.

#### Additional resources

- [Populating OperatorHub from mirrored Operator catalogs](#)

## 3.10. NEXT STEPS

- Install a cluster on infrastructure that you provision in your restricted network, such as on [VMware vSphere](#), [bare metal](#), or [Amazon Web Services](#).

## 3.11. ADDITIONAL RESOURCES

- See [Gathering data about specific features](#) for more information about using must-gather.

## CHAPTER 4. INSTALLING ON AWS

### 4.1. PREPARING TO INSTALL ON AWS

#### 4.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 4.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See [Configuring an AWS account](#) for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for AWS](#) for other options, including [configuring the Cloud Credential Operator \(CCO\) to use the Amazon Web Services Security Token Service \(AWS STS\)](#).

#### 4.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 4.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- [Installing a cluster quickly on AWS](#) You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- [Installing a customized cluster on AWS](#) You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- [Installing a cluster on AWS with network customizations](#) You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- [Installing a cluster on AWS in a restricted network](#) You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the

installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.

- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.
- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

#### 4.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.
- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

#### 4.1.4. Next steps

- [Configuring an AWS account](#)

## 4.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

### 4.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.

**NOTE**

If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see [Registering Domain Names Using Amazon Route 53](#) in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See [Making Amazon Route 53 the DNS Service for an Existing Domain](#) in the AWS documentation.
3. Create a public hosted zone for your domain or subdomain. See [Creating a Public Hosted Zone](#) in the AWS documentation.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. Extract the new authoritative name servers from the hosted zone records. See [Getting the Name Servers for a Public Hosted Zone](#) in the AWS documentation.
5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: [Adding or Changing Name Servers or Glue Records](#).
6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See [Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain](#) in the AWS documentation for an example high level procedure.

#### 4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses **us-gov-west-1** region for Route53 and tagging API clients.

The Ingress Operator uses <https://tagging.us-gov-west-1.amazonaws.com> as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the [Service Endpoints](#) in the AWS documentation about GovCloud (US).

**IMPORTANT**

Private, disconnected installations are not supported for AWS GovCloud when you install in the **us-gov-east-1** region.

#### Example Route 53 configuration

```
platform:
  aws:
    region: us-gov-west-1
    serviceEndpoints:
      - name: ec2
        url: https://ec2.us-gov-west-1.amazonaws.com
      - name: elasticloadbalancing
        url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
      - name: route53
```

```
url: https://route53.us-gov.amazonaws.com 1
- name: tagging
url: https://tagging.us-gov-west-1.amazonaws.com 2
```

- 1** Route 53 defaults to <https://route53.us-gov.amazonaws.com> for both AWS GovCloud (US) regions.
- 2** Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

## 4.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default [Service Limits](#) affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of clusters available by default	Default AWS limit	Description
Instance Limits	Varies	Varies	<p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>● One bootstrap machine, which is removed after installation</li> <li>● Three control plane nodes</li> <li>● Three worker nodes</li> </ul> <p>These instance type counts are within a new account's default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.</p> <p>In most regions, the bootstrap and worker machines uses an <b>m4.large</b> machines and the control plane machines use <b>m4.xlarge</b> instances. In some regions, including all regions that do not support these instance types, <b>m5.large</b> and <b>m5.xlarge</b> instances are used instead.</p>

Component	Number of clusters available by default	Default AWS limit	Description
Elastic IPs (EIPs)	0 to 1	5 EIPs per account	<p>To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each <a href="#">availability zone within a region</a>. Each private subnet requires a <a href="#">NAT Gateway</a>, and each NAT gateway requires a separate <a href="#">elastic IP</a>. Review the <a href="#">AWS region map</a> to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit.</p> <div style="display: flex; align-items: flex-start; margin-top: 20px;">  <div> <p><b>IMPORTANT</b></p> <p>To use the <b>us-east-1</b> region, you must increase the EIP limit for your account.</p> </div> </div>
Virtual Private Clouds (VPCs)	5	5 VPCs per region	Each cluster creates its own VPC.
Elastic Load Balancing (ELB/NLB)	3	20 per region	By default, each cluster creates internal and external network load balancers for the master API server and a single classic elastic load balancer for the router. Deploying more Kubernetes <b>Service</b> objects with type <b>LoadBalancer</b> will create additional <a href="#">load balancers</a> .
NAT Gateways	5	5 per availability zone	The cluster deploys one NAT gateway in each availability zone.
Elastic Network Interfaces (ENIs)	At least 12	350 per region	<p>The default installation creates 21 ENIs and an ENI for each availability zone in your region. For example, the <b>us-east-1</b> region contains six availability zones, so a cluster that is deployed in that zone uses 27 ENIs. Review the <a href="#">AWS region map</a> to determine how many availability zones are in each region.</p> <p>Additional ENIs are created for additional machines and elastic load balancers that are created by cluster usage and deployed workloads.</p>

Component	Number of clusters available by default	Default AWS limit	Description
VPC Gateway	20	20 per account	Each cluster creates a single VPC Gateway for S3 access.
S3 buckets	99	100 buckets per account	Because the installation process creates a temporary bucket and the registry component in each cluster creates a bucket, you can create only 99 OpenShift Container Platform clusters per AWS account.
Security Groups	250	2,500 per account	Each cluster creates 10 distinct security groups.

### 4.2.3. Required AWS permissions for the IAM user

#### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

#### Example 4.1. Required EC2 permissions for installation

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**

- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**

- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.2. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

Example 4.3. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**

- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

Example 4.4. Required Elastic Load Balancing permissions (ELBv2) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

#### Example 4.5. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

#### NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

#### Example 4.6. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**

- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 4.7. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.8. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.9. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam>ListAttachedRolePolicies**
- **iam>ListInstanceProfiles**
- **iam>ListRolePolicies**
- **iam>ListUserPolicies**
- **s3:DeleteObject**
- **s3>ListBucketVersions**
- **tag:GetResources**

Example 4.10. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**

- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

#### Example 4.11. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

#### Example 4.12. Additional IAM and S3 permissions that are required to create manifests

- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3>ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 4.13. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

**4.2.4. Creating an IAM user**

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the [Creating an IAM User in Your AWS Account](#) procedure in the AWS documentation, set the following options:

**Procedure**

1. Specify the IAM user name and select **Programmatic access**.
2. Attach the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

**NOTE**

While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.
4. Confirm that the user name that you specified is granted the **AdministratorAccess** policy.
5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.

**IMPORTANT**

You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials.

## Additional resources

- See [Manually creating IAM for AWS](#) for steps to set the Cloud Credential Operator (CCO) to manual mode prior to installation. Use this mode in environments where the cloud identity and access management (IAM) APIs are not reachable, or if you prefer not to store an administrator-level credential secret in the cluster **kube-system** project.

### 4.2.5. IAM Policies and AWS authentication

By default, the installation program creates instance profiles for the bootstrap, control plane, and compute instances with the necessary permissions for the cluster to operate.

However, you can create your own IAM roles and specify them as part of the installation process. You might need to specify your own roles to deploy the cluster or to manage the cluster after installation. For example:

- Your organization's security policies require that you use a more restrictive set of permissions to install the cluster.
- After the installation, the cluster is configured with an Operator that requires access to additional services.

If you choose to specify your own IAM roles, you can take the following steps:

- Begin with the default policies and adapt as required. For more information, see "Default permissions for IAM instance profiles".
- Use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template that is based on the cluster's activity. For more information see, "Using AWS IAM Analyzer to create policy templates".

#### 4.2.5.1. Default permissions for IAM instance profiles

By default, the installation program creates IAM instance profiles for the bootstrap, control plane and worker instances with the necessary permissions for the cluster to operate.

The following lists specify the default permissions for control plane and compute machines:

##### Example 4.14. Default IAM role permissions for control plane instance profiles

- **ec2:AttachVolume**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteVolume**
- **ec2:Describe\***
- **ec2:DetachVolume**

- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyVolume**
- **ec2:RevokeSecurityGroupIngress**
- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerPolicy**
- **elasticloadbalancing:CreateLoadBalancerListeners**
- **elasticloadbalancing:CreateTargetGroup**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>DeleteListener**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing>DeleteLoadBalancerListeners**
- **elasticloadbalancing>DeleteTargetGroup**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:Describe\***
- **elasticloadbalancing:DetachLoadBalancerFromSubnets**
- **elasticloadbalancing:ModifyListener**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:RegisterTargets**
- **elasticloadbalancing:SetLoadBalancerPoliciesForBackendServer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**
- **kms:DescribeKey**

#### Example 4.15. Default IAM role permissions for compute instance profiles

- **ec2:DescribeInstances**
- **ec2:DescribeRegions**

#### 4.2.5.2. Specifying an existing IAM role

Instead of allowing the installation program to create IAM instance profiles with the default permissions, you can use the **install-config.yaml** file to specify an existing IAM role for control plane and compute instances.

##### Prerequisites

- You have an existing **install-config.yaml** file.

##### Procedure

1. Update **compute.platform.aws.iamRole** with an existing role for the control plane machines.

##### Sample install-config.yaml file with an IAM role for compute instances

```
compute:
  - hyperthreading: Enabled
    name: worker
  platform:
    aws:
      iamRole: ExampleRole
```

2. Update **controlPlane.platform.aws.iamRole** with an existing role for the compute machines.

##### Sample install-config.yaml file with an IAM role for control plane instances

```
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      iamRole: ExampleRole
```

3. Save the file and reference it when installing the OpenShift Container Platform cluster.

##### Additional resources

- See [Deploying the cluster](#).

#### 4.2.5.3. Using AWS IAM Analyzer to create policy templates

The minimal set of permissions that the control plane and compute instance profiles require depends on how the cluster is configured for its daily operation.

One way to determine which permissions the cluster instances require is to use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template:

- A policy template contains the permissions the cluster has used over a specified period of time.
- You can then use the template to create policies with fine-grained permissions.

## Procedure

The overall process could be:

1. Ensure that CloudTrail is enabled. CloudTrail records all of the actions and events in your AWS account, including the API calls that are required to create a policy template. For more information, see the AWS documentation for [working with CloudTrail](#).
2. Create an instance profile for control plane instances and an instance profile for compute instances. Be sure to assign each role a permissive policy, such as PowerUserAccess. For more information, see the AWS documentation for [creating instance profile roles](#).
3. Install the cluster in a development environment and configure it as required. Be sure to deploy all of applications the cluster will host in a production environment.
4. Test the cluster thoroughly. Testing the cluster ensures that all of the required API calls are logged.
5. Use the IAM Access Analyzer to create a policy template for each instance profile. For more information, see the AWS documentation for [generating policies based on the CloudTrail logs](#).
6. Create and add a fine-grained policy to each instance profile.
7. Remove the permissive policy from each instance profile.
8. Deploy a production cluster using the existing instance profiles with the new policies.

### NOTE

You can add [IAM Conditions](#) to your policy to make it more restrictive and compliant with your organization security requirements.

## 4.2.6. Supported AWS Marketplace regions

Installing an OpenShift Container Platform cluster using an AWS Marketplace image is available to customers who purchase the offer in North America.

While the offer must be purchased in North America, you can deploy the cluster to any of the following supported partitions:

- Public
- GovCloud

### NOTE

Deploying a OpenShift Container Platform cluster using an AWS Marketplace image is not supported for the AWS secret regions or China regions.

## 4.2.7. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following regions.

### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

### 4.2.7.1. AWS public regions

The following AWS public regions are supported:

- **af-south-1** (Cape Town)
- **ap-east-1** (Hong Kong)
- **ap-northeast-1** (Tokyo)
- **ap-northeast-2** (Seoul)
- **ap-northeast-3** (Osaka)
- **ap-south-1** (Mumbai)
- **ap-southeast-1** (Singapore)
- **ap-southeast-2** (Sydney)
- **ca-central-1** (Central)
- **eu-central-1** (Frankfurt)
- **eu-north-1** (Stockholm)
- **eu-south-1** (Milan)
- **eu-west-1** (Ireland)
- **eu-west-2** (London)
- **eu-west-3** (Paris)
- **me-south-1** (Bahrain)
- **sa-east-1** (São Paulo)
- **us-east-1** (N. Virginia)
- **us-east-2** (Ohio)
- **us-west-1** (N. California)
- **us-west-2** (Oregon)

### 4.2.7.2. AWS GovCloud regions

The following AWS GovCloud regions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

#### 4.2.7.3. AWS C2S Secret region

The **us-iso-east-1** region is supported.

#### 4.2.7.4. AWS China regions

The following AWS China regions are supported:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

### 4.2.8. Next steps

- Install an OpenShift Container Platform cluster:
  - [Quickly install a cluster](#) with default options on installer-provisioned infrastructure
  - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
  - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

## 4.3. MANUALLY CREATING IAM FOR AWS

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

### 4.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Use the Amazon Web Services Security Token Service**  
You can use the CCO utility (**ccoctl**) to configure the cluster to use the Amazon Web Services Security Token Service (AWS STS). When the CCO utility is used to configure the cluster for STS, it assigns IAM roles that provide short-term, limited-privilege security credentials to components.

**NOTE**

This credentials strategy is supported for only new OpenShift Container Platform clusters and must be configured during installation. You cannot reconfigure an existing cluster that uses a different credentials strategy to use this feature.

- **Manage cloud credentials manually.**

You can set the **credentialsMode** parameter for the CCO to **Manual** to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**

If you are using the CCO with the **credentialsMode** parameter set to **Mint**, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

**Additional resources**

- To learn how to use the CCO utility (**ccoctl**) to configure the CCO to use the AWS STS, see [Using manual mode with STS](#).
- To learn how to rotate or remove the administrator-level credential secret after installing OpenShift Container Platform, see [Rotating or removing cloud provider credentials](#).
- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

**4.3.2. Manually create IAM**

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

**Procedure**

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

### Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
  --credentials-requests \
  --cloud=aws
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
```

```

apiVersion: cloudcredential.openshift.io/v1
kind: AWSProviderSpec
statementEntries:
- effect: Allow
  action:
  - iam:GetUser
  - iam:GetUserPolicy
  - iam:ListAccessKeys
  resource: "*"
...

```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample CredentialsRequest object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
    - effect: Allow
      action:
      - s3:CreateBucket
      - s3>DeleteBucket
      resource: "*"
    ...
  secretRef:
    name: <component-secret>
    namespace: <component-namespace>
...

```

### Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component-secret>
  namespace: <component-namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

## IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

### 4.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.8 to 4.9, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.
- For z-stream releases, for example, from 4.9.0 to 4.9.1, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

#### Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release. The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.
2. Update the manually maintained credentials on your cluster:
  - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
  - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.
3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:
  - a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.
  - b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

#### Text to add

```
...
metadata:
  annotations:
    cloudcredential.openshift.io/upgradeable-to: <version_number>
...
```

-

Where **<version\_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
  - a. In the **Administrator** perspective of the web console, navigate to **Administration → Cluster Settings**.
  - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
  - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

:\_content-type: CONCEPT

#### 4.3.4. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the **admin** credential is stored in the **kube-system** namespace and then used by the CCO to process the **CredentialsRequest** objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires **admin** credential storage in a cluster **kube-system** secret.

#### 4.3.5. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all **CredentialsRequest** objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

**NOTE**

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

**4.3.6. Next steps**

- Install an OpenShift Container Platform cluster:
  - [Installing a cluster quickly on AWS](#) with default options on installer-provisioned infrastructure
  - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
  - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

**4.4. INSTALLING A CLUSTER QUICKLY ON AWS**

In OpenShift Container Platform version 4.9, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

**4.4.1. Prerequisites**

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment,

or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#). Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

#### 4.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 4.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform

components.

#### 4.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **aws** as the platform to target.

- c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- d. Select the AWS region to deploy the cluster to.
- e. Select the base domain for the Route 53 service that you configured for your cluster.
- f. Enter a descriptive name for your cluster.
- g. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

**Additional resources**

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

**4.4.6. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### 4.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

##### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

##### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

##### Example output

```
system:admin
```

#### 4.4.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

##### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

##### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

- List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

**Example output**

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

- Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

**4.4.9. Telemetry access for OpenShift Container Platform**

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service

**4.4.10. Next steps**

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 4.5. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.9, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

### 4.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 4.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

## IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

## NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

## NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

#### 4.5.4. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

## NOTE

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported in the secret regions or China regions.

## Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

## Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

## Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239 1
      type: m5.4xlarge
    replicas: 3
  metadata:
    name: test-cluster
  platform:
    aws:
      region: us-east-2 2
  sshKey: ssh-ed25519 AAAA...
  pullSecret: '{"auths": ...}'
```

- 1** The AMI ID from your AWS Marketplace subscription.
- 2** Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

### 4.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

## Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 4.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

### Procedure

1. Create the **install-config.yaml** file.

- a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
- i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.5.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 4.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.1. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object

Parameter	Description	Values
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.2. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

#### 4.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.3. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	<p>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</p>	String
<b>compute</b>	<p>The configuration for the machines that comprise the compute nodes.</p>	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 512 595 864" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <div data-bbox="485 909 595 1261" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.5.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.4. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m5.xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .

Parameter	Description	Values
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

#### 4.5.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.5. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.5.6.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

##### Example 4.16. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x

Instance type	Bootstrap	Control plane	Compute
m5.xlarge		x	x
m5.2xlarge		x	x
m5.4xlarge		x	x
m5.8xlarge		x	x
m5.12xlarge		x	x
m5.16xlarge		x	x
m5a.large			x
m5a.xlarge		x	x
m5a.2xlarge		x	x
m5a.4xlarge		x	x
m5a.8xlarge		x	x
m5a.12xlarge		x	x
m5a.16xlarge		x	x
m6i.xlarge		x	x
m6i.2xlarge		x	x
m6i.4xlarge		x	x
m6i.8xlarge		x	x
m6i.16xlarge		x	x
c4.2xlarge		x	x
c4.4xlarge		x	x
c4.8xlarge		x	x
c5.xlarge			x
c5.2xlarge		x	x

Instance type	Bootstrap	Control plane	Compute
<b>c5.4xlarge</b>		x	x
<b>c5.9xlarge</b>		x	x
<b>c5.12xlarge</b>		x	x
<b>c5.18xlarge</b>		x	x
<b>c5.24xlarge</b>		x	x
<b>c5a.xlarge</b>			x
<b>c5a.2xlarge</b>		x	x
<b>c5a.4xlarge</b>		x	x
<b>c5a.8xlarge</b>		x	x
<b>c5a.12xlarge</b>		x	x
<b>c5a.16xlarge</b>		x	x
<b>c5a.24xlarge</b>		x	x
<b>r4.large</b>			x
<b>r4.xlarge</b>		x	x
<b>r4.2xlarge</b>		x	x
<b>r4.4xlarge</b>		x	x
<b>r4.8xlarge</b>		x	x
<b>r4.16xlarge</b>		x	x
<b>r5.large</b>			x
<b>r5.xlarge</b>		x	x
<b>r5.2xlarge</b>		x	x
<b>r5.4xlarge</b>		x	x
<b>r5.8xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
r5.12xlarge		x	x
r5.16xlarge		x	x
r5.24xlarge		x	x
r5a.large			x
r5a.xlarge		x	x
r5a.2xlarge		x	x
r5a.4xlarge		x	x
r5a.8xlarge		x	x
r5a.12xlarge		x	x
r5a.16xlarge		x	x
r5a.24xlarge		x	x
t3.large			x
t3.xlarge			x
t3.2xlarge			x
t3a.large			x
t3a.xlarge			x
t3a.2xlarge			x

#### 4.5.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      type: m5.xlarge
    replicas: 3
compute: 7
- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
        - us-west-2c
    replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
    amiID: ami-96c6f8f7 12
    serviceEndpoints: 13
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  fips: false 14
sshKey: ssh-ed25519 AAAA... 15
pullSecret: '{"auths": ...}' 16
```

- 
- 1 10 11 16 Required. The installation program prompts you for this value.
- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iopts** to **2000**.
- 12 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 13 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 14 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 15 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### 4.5.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

#### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

**1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

**2** A proxy URL to use for creating HTTPS connections outside the cluster.

- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

#### 4.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

##### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

##### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.5.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

#### 4.5.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

##### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

#### 4.5.12. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.6. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.9, you can install a cluster on Amazon Web Services (AWS) with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### 4.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

## IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 4.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

Agent pid 31874

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 4.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

## IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.6.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

## NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

#### Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 4.6.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

## Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.6.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

##### 4.6.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.6. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .

Parameter	Description	Values
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.6.6.1.2. Network configuration parameters

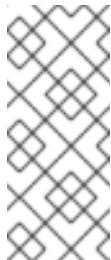

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.7. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object   <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:   - cidr: 10.128.0.0/14     hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:   - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

#### 4.6.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.8. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p>  <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.6.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.9. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .

Parameter	Description	Values
<code>compute.platform.aws.rootVolume.type</code>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<code>compute.platform.aws.rootVolume.kmsKeyARN</code>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID or the key ARN</a>
<code>compute.platform.aws.type</code>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<code>compute.platform.aws.zones</code>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<code>compute.aws.region</code>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<code>controlPlane.platform.aws.amiID</code>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<code>controlPlane.platform.aws.iamRole</code>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<code>controlPlane.platform.aws.rootVolume.kmsKeyARN</code>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID and the key ARN</a>

Parameter	Description	Values
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m5.xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.

Parameter	Description	Values
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

#### 4.6.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.10. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.6.6.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.17. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x

#### 4.6.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
name: master
platform:
  aws:
    zones:
      - us-west-2a

```

```

- us-west-2b
rootVolume:
  iops: 4000
  size: 500
  type: io1 6
  type: m5.xlarge
replicas: 3
compute: 7
- hyperthreading: Enabled 8
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
      type: c5.4xlarge
    zones:
      - us-west-2c
replicas: 3
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 12
    userTags:
      adminContact: jdoe
      costCenter: 7536
    amiID: ami-96c6f8f7 13
    serviceEndpoints: 14
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  fips: false 15
sshKey: ssh-ed25519 AAAA... 16
pullSecret: '{"auths": ...}' 17

```

**1 10 12 17** Required. The installation program prompts you for this value.

**2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.

**3 7 11** If you do not provide these parameters and values, the installation program provides the default value.

- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 4.6.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.

- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The

**additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.6.7. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

#### **clusterNetwork**

IP address pools from which pod IP addresses are allocated.

#### **serviceNetwork**

IP address pool for services.

#### **defaultNetwork.type**

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

#### 4.6.7.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 4.11. Cluster Network Operator configuration object**

Field	Type	Description
<b>metadata.name</b>	<b>string</b>	The name of the CNO object. This name is always <b>cluster</b> .

Field	Type	Description
<b>spec.clusterNetwork</b>	<b>array</b>	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:   - cidr: 10.128.0.0/19     hostPrefix: 23   - cidr: 10.128.32.0/19     hostPrefix: 23</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.serviceNetwork</b>	<b>array</b>	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:   - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.defaultNetwork</b>	<b>object</b>	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
<b>spec.kubeProxy</b> <b>Config</b>	<b>object</b>	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

### defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 4.12. **defaultNetwork** object

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>type</b>	<b>string</b>	<p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
<b>openshiftSDNConfig</b>	<b>object</b>	This object is only valid for the OpenShift SDN cluster network provider.
<b>ovnKubernetesConfig</b>	<b>object</b>	This object is only valid for the OVN-Kubernetes cluster network provider.

#### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 4.13. **openshiftSDNConfig** object

Field	Type	Description
<b>mode</b>	<b>string</b>	<p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>vxlanPort</b>	<b>integer</b>	<p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>

### Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 4.14. `ovnKubernetesConfig` object

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>genevePort</b>	<b>integer</b>	The port to use for all Geneve packets. The default value is <b>6081</b> . This value cannot be changed after cluster installation.
<b>ipsecConfig</b>	<b>object</b>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<b>policyAuditConfig</b>	<b>object</b>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Table 4.15. **policyAuditConfig** object

Field	Type	Description
<b>rateLimit</b>	integer	The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second.
<b>maxFileSize</b>	integer	The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.

Field	Type	Description
<b>destination</b>	string	<p>One of the following additional audit log targets:</p> <p><b>libc</b> The libc <b>syslog()</b> function of the journald process on the host.</p> <p><b>udp:&lt;host&gt;:&lt;port&gt;</b> A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server.</p> <p><b>unix:&lt;file&gt;</b> A Unix Domain Socket file specified by <b>&lt;file&gt;</b>.</p> <p><b>null</b> Do not send the audit logs to any additional target.</p>
<b>syslogFacility</b>	string	The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .

### Example OVN-Kubernetes configuration

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

### kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 4.16. **kubeProxyConfig** object

Field	Type	Description
<b>iptablesSyncPeriod</b>	<b>string</b>	<p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div>

Field	Type	Description
<b>proxyArguments.iptables-min-sync-period</b>	<b>array</b>	<p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>

#### 4.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

#### IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

#### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

### Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

#### NOTE

For more information on using a Network Load Balancer (NLB) on AWS, see [Configuring Ingress cluster traffic on AWS using a Network Load Balancer](#).

## 4.6.9. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

### Prerequisites

- Create the **install-config.yaml** file and complete any modifications to it.

### Procedure

Create an Ingress Controller backed by an AWS NLB on a new cluster.

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- For **<installation\_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation\_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- 1 For **<installation\_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

### Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  creationTimestamp: null
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      scope: External
      providerParameters:
        type: AWS
      aws:
        type: NLB
    type: LoadBalancerService
```

4. Save the **cluster-ingress-default-ingresscontroller.yaml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-ingress-default-ingresscontroller.yaml** file. The installation program deletes the **manifests/** directory when creating the cluster.

#### 4.6.10. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

#### IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

## Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

## Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

### <installation\_directory>

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  EOF
```

where:

### <installation\_directory>

Specifies the directory name that contains the **manifests/** directory for your cluster.

- Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

## Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
          hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.

- 2 Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

#### NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

#### NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

### 4.6.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

**4.6.12. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.6.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.6.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

#### 4.6.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

##### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

#### 4.6.16. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.7. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

In OpenShift Container Platform version 4.9, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

### 4.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

#### IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry

- Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

### NOTE

If you are configuring a proxy, be sure to also review this site list.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## 4.7.2. About installations in restricted networks

In OpenShift Container Platform 4.9, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

### 4.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 4.7.3. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 4.7.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in

the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.

- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

### Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

### Top secret region

- **ec2.<region>.c2s.ic.gov**
- **elasticloadbalancing.<region>.c2s.ic.gov**
- **s3.<region>.c2s.ic.gov**

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkAclAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

#### 4.7.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

#### 4.7.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 4.7.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 4.7.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.7.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

#### 4.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

##### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the **imageContentSources** values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

##### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

##### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

##### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.

- iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.
- a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<mirror_host_name>:5000": {"auth": "<credentials>","email":
"you@example.com"}}}'
```

For **<mirror\_host\_name>**, specify the registry domain name that you specified in the certificate for your mirror registry, and for **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  ////////////////////////////////////////////////////////////////////
  -----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

- c. Define the subnets for the VPC to install the cluster in:

```
subnets:
- subnet-1
- subnet-2
- subnet-3
```

- d. Add the image content resources, which look like this excerpt:

```
imageContentSources:
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
  source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
  source: registry.redhat.io/ocp/release
```

To complete these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

##### 4.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.17. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.18. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object   <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

#### 4.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.19. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	<p>A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.</p>	String
<b>compute</b>	<p>The configuration for the machines that comprise the compute nodes.</p>	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hypert hreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platfor m</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replica s</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start; gap: 10px;"> <div style="width: 60px; height: 150px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; gap: 10px; margin-top: 10px;"> <div style="width: 60px; height: 80px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.7.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.20. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.

Parameter	Description	Values
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m5.xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .

Parameter	Description	Values
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

#### 4.7.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.21. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.7.6.3. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
hyperthreading: Enabled 5
name: master
platform:
  aws:
    zones:
      - us-west-2a
      - us-west-2b
    rootVolume:
      iops: 4000
      size: 500
      type: io1 6
      type: m5.xlarge
    replicas: 3
  compute: 7

```

```

- hyperthreading: Enabled 8
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 9
      type: c5.4xlarge
      zones:
        - us-west-2c
    replicas: 3
  metadata:
    name: test-cluster 10
  networking:
    clusterNetwork:
      - cidr: 10.128.0.0/14
      hostPrefix: 23
    machineNetwork:
      - cidr: 10.0.0.0/16
    networkType: OpenShiftSDN
    serviceNetwork:
      - 172.30.0.0/16
  platform:
    aws:
      region: us-west-2 11
      userTags:
        adminContact: jdoe
        costCenter: 7536
      subnets: 12
      - subnet-1
      - subnet-2
      - subnet-3
      amiID: ami-96c6f8f7 13
      serviceEndpoints: 14
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
      hostedZone: Z3URY6TWQ91KVV 15
    fips: false 16
    sshKey: ssh-ed25519 AAAA... 17
    pullSecret: '{"auths":{"<local_registry>":{"auth": "<credentials>","email": "you@example.com"}}}' 18
    additionalTrustBundle: | 19
      -----BEGIN CERTIFICATE-----
      <MY_TRUSTED_CA_CERT>
      -----END CERTIFICATE-----
    imageContentSources: 20
    - mirrors:
      - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-release
    - mirrors:
      - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-v4.0-art-dev

```

**1** **10** **11** Required. The installation program prompts you for this value.

- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 For **<local\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.
- 19 Provide the contents of the certificate file that you used for your mirror registry.
- 20 Provide the **imageContentSources** section from the output of the command to mirror the repository.

#### 4.7.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

##### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

##### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
```

```

baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

## Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/./openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

#### 4.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

##### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**. To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**. To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.7.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.7.10. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

#### Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \  
-p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

## TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

### 4.7.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 4.7.12. Next steps

- [Validate an installation](#).
- [Customize your cluster](#).
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#).
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#).

## 4.8. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

In OpenShift Container Platform version 4.9, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 4.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

## IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 4.8.2. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 4.8.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

## NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- Create a public and private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet. For an example of this type of configuration, see [VPC with public and private subnets \(NAT\)](#) in the AWS documentation.  
Record each subnet ID. Completing the installation requires that you enter these values in the **platform** section of the **install-config.yaml** file. See [Finding a subnet ID](#) in the AWS documentation.
- The VPC's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.
- The VPC must have a public internet gateway attached to it. For each availability zone:
  - The public subnet requires a route to the internet gateway.
  - The public subnet requires a NAT gateway with an EIP address.
  - The private subnet requires a route to the NAT gateway in public subnet.
- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag.  
The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.  
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

#### Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

## Top secret region

- **ec2.<region>.c2s.ic.gov**
- **elasticloadbalancing.<region>.c2s.ic.gov**
- **s3.<region>.c2s.ic.gov**

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description						
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.						
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.						
Internet gateway	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::InternetGateway</b></li> <li>• <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>• <b>AWS::EC2::RouteTable</b></li> <li>• <b>AWS::EC2::Route</b></li> <li>• <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>• <b>AWS::EC2::NatGateway</b></li> <li>• <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.						
Network access control	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::NetworkACL</b></li> <li>• <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic
Port	Reason							
<b>80</b>	Inbound HTTP traffic							
<b>443</b>	Inbound HTTPS traffic							

Component	AWS type	Description	
		<b>22</b>	Inbound SSH traffic
		<b>1024 - 65535</b>	Inbound ephemeral traffic
		<b>0 - 65535</b>	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

#### 4.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

#### 4.8.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions

that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 4.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 4.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

■

```
$ eval "$(ssh-agent -s)"
```

### Example output

```
Agent pid 31874
```

### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 4.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

## IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

## IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:

- i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

##### 4.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.22. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 4.23. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

#### 4.8.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.24. Optional parameters**

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="background-color: black; width: 60px; height: 100px; margin-right: 10px;">  </div> <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 510 595 862" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <div data-bbox="485 907 595 1258" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</pre>

#### 4.8.6.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.25. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>

Parameter	Description	Values
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m5.xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.

Parameter	Description	Values
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

#### 4.8.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.26. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.8.6.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.18. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x
<b>m6i.16xlarge</b>		x	x
<b>c4.2xlarge</b>		x	x
<b>c4.4xlarge</b>		x	x
<b>c4.8xlarge</b>		x	x
<b>c5.xlarge</b>			x
<b>c5.2xlarge</b>		x	x
<b>c5.4xlarge</b>		x	x
<b>c5.9xlarge</b>		x	x
<b>c5.12xlarge</b>		x	x
<b>c5.18xlarge</b>		x	x
<b>c5.24xlarge</b>		x	x
<b>c5a.xlarge</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>c5a.2xlarge</b>		x	x
<b>c5a.4xlarge</b>		x	x
<b>c5a.8xlarge</b>		x	x
<b>c5a.12xlarge</b>		x	x
<b>c5a.16xlarge</b>		x	x
<b>c5a.24xlarge</b>		x	x
<b>r4.large</b>			x
<b>r4.xlarge</b>		x	x
<b>r4.2xlarge</b>		x	x
<b>r4.4xlarge</b>		x	x
<b>r4.8xlarge</b>		x	x
<b>r4.16xlarge</b>		x	x
<b>r5.large</b>			x
<b>r5.xlarge</b>		x	x
<b>r5.2xlarge</b>		x	x
<b>r5.4xlarge</b>		x	x
<b>r5.8xlarge</b>		x	x
<b>r5.12xlarge</b>		x	x
<b>r5.16xlarge</b>		x	x
<b>r5.24xlarge</b>		x	x
<b>r5a.large</b>			x
<b>r5a.xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>r5a.2xlarge</b>		x	x
<b>r5a.4xlarge</b>		x	x
<b>r5a.8xlarge</b>		x	x
<b>r5a.12xlarge</b>		x	x
<b>r5a.16xlarge</b>		x	x
<b>r5a.24xlarge</b>		x	x
<b>t3.large</b>			x
<b>t3.xlarge</b>			x
<b>t3.2xlarge</b>			x
<b>t3a.large</b>			x
<b>t3a.xlarge</b>			x
<b>t3a.2xlarge</b>			x

#### 4.8.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
name: master
platform:
  aws:
    zones:
      - us-west-2a

```

```

- us-west-2b
rootVolume:
  iops: 4000
  size: 500
  type: io1 6
  type: m5.xlarge
replicas: 3
compute: 7
- hyperthreading: Enabled 8
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
      type: c5.4xlarge
    zones:
      - us-west-2c
replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: 12
    - subnet-1
    - subnet-2
    - subnet-3
    amiID: ami-96c6f8f7 13
    serviceEndpoints: 14
    - name: ec2
      url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KVV 15
  fips: false 16
  sshKey: ssh-ed25519 AAAA... 17
  pullSecret: '{"auths": ...}' 18

```

**1** **10** **11** **18** Required. The installation program prompts you for this value.

**2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators*

For details about OCP images, see the [Cloud Credential Operator](#) entry in the [Platform Operators reference content](#).

- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### 4.8.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

#### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

**1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

**2** A proxy URL to use for creating HTTPS connections outside the cluster.

- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.8.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

**4.8.8. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.8.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.8.10. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.8.12. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.9. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.9, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 4.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## 4.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 4.9.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 4.9.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

### 4.9.3. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 4.9.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

#### Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

#### Top secret region

- **ec2.<region>.c2s.ic.gov**
- **elasticloadbalancing.<region>.c2s.ic.gov**
- **s3.<region>.c2s.ic.gov**

#### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description												
VPC	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::VPC</b></li> <li>● <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.												
Public subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::SubnetNetworkAclAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													

Component	AWS type	Description
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

#### 4.9.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

#### 4.9.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 4.9.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 4.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.9.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**4.9.6. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

#### NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation\_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 4.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 4.9.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.27. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .

Parameter	Description	Values
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.28. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:   - cidr: 10.128.0.0/14     hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:   - 172.30.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation.  For example, <b>10.0.0.0/16</b> .   <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p>

#### 4.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.29. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</pre>

#### 4.9.7.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.30. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>

Parameter	Description	Values
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m5.xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.

Parameter	Description	Values
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

#### 4.9.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.31. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.9.7.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.19. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x
<b>m6i.16xlarge</b>		x	x
<b>c4.2xlarge</b>		x	x
<b>c4.4xlarge</b>		x	x
<b>c4.8xlarge</b>		x	x
<b>c5.xlarge</b>			x
<b>c5.2xlarge</b>		x	x
<b>c5.4xlarge</b>		x	x
<b>c5.9xlarge</b>		x	x
<b>c5.12xlarge</b>		x	x
<b>c5.18xlarge</b>		x	x
<b>c5.24xlarge</b>		x	x
<b>c5a.xlarge</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>c5a.2xlarge</b>		x	x
<b>c5a.4xlarge</b>		x	x
<b>c5a.8xlarge</b>		x	x
<b>c5a.12xlarge</b>		x	x
<b>c5a.16xlarge</b>		x	x
<b>c5a.24xlarge</b>		x	x
<b>r4.large</b>			x
<b>r4.xlarge</b>		x	x
<b>r4.2xlarge</b>		x	x
<b>r4.4xlarge</b>		x	x
<b>r4.8xlarge</b>		x	x
<b>r4.16xlarge</b>		x	x
<b>r5.large</b>			x
<b>r5.xlarge</b>		x	x
<b>r5.2xlarge</b>		x	x
<b>r5.4xlarge</b>		x	x
<b>r5.8xlarge</b>		x	x
<b>r5.12xlarge</b>		x	x
<b>r5.16xlarge</b>		x	x
<b>r5.24xlarge</b>		x	x
<b>r5a.large</b>			x
<b>r5a.xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>r5a.2xlarge</b>		x	x
<b>r5a.4xlarge</b>		x	x
<b>r5a.8xlarge</b>		x	x
<b>r5a.12xlarge</b>		x	x
<b>r5a.16xlarge</b>		x	x
<b>r5a.24xlarge</b>		x	x
<b>t3.large</b>			x
<b>t3.xlarge</b>			x
<b>t3.2xlarge</b>			x
<b>t3a.large</b>			x
<b>t3a.xlarge</b>			x
<b>t3a.2xlarge</b>			x

#### 4.9.7.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
name: master
platform:
  aws:
    zones:
      - us-west-2a

```

```

- us-west-2b
rootVolume:
  iops: 4000
  size: 500
  type: io1 6
  type: m5.xlarge
replicas: 3
compute: 7
- hyperthreading: Enabled 8
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
      type: c5.4xlarge
    zones:
      - us-west-2c
replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: 12
    - subnet-1
    - subnet-2
    - subnet-3
    amiID: ami-96c6f8f7 13
    serviceEndpoints: 14
    - name: ec2
      url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KVV 15
  fips: false 16
  sshKey: ssh-ed25519 AAAA... 17
  publish: Internal 18
  pullSecret: '{"auths": ...}' 19

```

**1** **10** **11** **19** Required. The installation program prompts you for this value.

**2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified

- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 13 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 14 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 15 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 18 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 4.9.7.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

##### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

##### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

##### Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 4.9.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

#### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**4.9.9. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.9.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.9.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.9.13. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 4.10. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT OR SECRET REGION

In OpenShift Container Platform version 4.9, you can install a cluster on Amazon Web Services (AWS) into a government or secret region. To configure the region, modify parameters in the **install-config.yaml** file before you install the cluster.

### 4.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 4.10.2. AWS government and secret regions

OpenShift Container Platform supports deploying a cluster to [AWS GovCloud \(US\)](#) regions and the [AWS Commercial Cloud Services \(C2S\) Top Secret Region](#). These regions are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

These regions do not have published Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Images (AMI) to select, so you must upload a custom AMI that belongs to that region.

The following AWS GovCloud partitions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

The following AWS Top Secret Region partition is supported:

- **us-iso-east-1**

#### NOTE

The maximum supported MTU in an AWS Top Secret Region is not the same as AWS commercial. For more information about configuring MTU during installation, see the *Cluster Network Operator configuration object* section in *Installing a cluster on AWS with network customizations*.

### 4.10.3. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image for the AWS government or secret regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (**install-config.yaml**).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

## IMPORTANT

If you are deploying to the C2S Top Secret Region, you must also define a custom CA certificate in the **additionalTrustBundle** field of the **install-config.yaml** file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the **AWS\_CA\_BUNDLE** environment variable, or define the CA bundle in the **ca\_bundle** field of the AWS config file.

### 4.10.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

## NOTE

Public zones are not supported in Route 53 in AWS GovCloud or Top Secret Regions. Therefore, clusters must be private if they are deployed to an AWS government or secret region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

## IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

#### 4.10.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for

access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 4.10.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

### 4.10.5. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 4.10.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs

- VPC DHCP options
- VPC endpoints

## NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag.  
The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.  
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

### Government regions

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

## Top secret region

- `ec2.<region>.c2s.ic.gov`
- `elasticloadbalancing.<region>.c2s.ic.gov`
- `s3.<region>.c2s.ic.gov`

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description						
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.						
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkAclAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.						
Internet gateway	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::InternetGateway</b></li> <li>• <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>• <b>AWS::EC2::RouteTable</b></li> <li>• <b>AWS::EC2::Route</b></li> <li>• <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>• <b>AWS::EC2::NatGateway</b></li> <li>• <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.						
Network access control	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::NetworkAcl</b></li> <li>• <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic
Port	Reason							
<b>80</b>	Inbound HTTP traffic							
<b>443</b>	Inbound HTTPS traffic							

Component	AWS type	Description	
		<b>22</b>	Inbound SSH traffic
		<b>1024 - 65535</b>	Inbound ephemeral traffic
		<b>0 - 65535</b>	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

#### 4.10.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

#### 4.10.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets,

routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 4.10.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 4.10.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.10.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

■

```
$ eval "$(ssh-agent -s)"
```

### Example output

```
Agent pid 31874
```

### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 4.10.8. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

- 1 The AWS profile name that holds your AWS credentials, like **govcloud**.

- Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

- The AWS region, like **us-gov-east-1**.

- Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

- The RHCOS VMDK version, like **4.9.0**.

- Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

- Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-{RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": "{VMIMPORT_BUCKET_NAME}",
    "S3Key": "rhcos-{RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

- Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region {AWS_DEFAULT_REGION} \
  --description "<description>" 1
  --disk-container "file://<file_path>/containers.json" 2
```

- The description of your RHCOS disk being imported, like **rhcos-**{RHCOS\_VERSION}**-x86\_64-aws.x86\_64**.

- The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

- Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region {AWS_DEFAULT_REGION}
```

### Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
```

```

    "ImportTaskId": "import-snap-fh6i8uil",
    "SnapshotTaskDetail": {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "DiskImageSize": 819056640.0,
      "Format": "VMDK",
      "SnapshotId": "snap-06331325870076318",
      "Status": "completed",
      "UserBucket": {
        "S3Bucket": "external-images",
        "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
      }
    }
  }
]
}

```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```

$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 3
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
[DeleteOnTermination=true,SnapshotId=<snapshot_ID>' 4

```

- 1** The RHCOS VMDK architecture type, like **x86\_64**, **s390x**, or **ppc64le**.
- 2** The **Description** from the imported snapshot.
- 3** The name of the RHCOS AMI.
- 4** The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

#### 4.10.9. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

#### NOTE

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported in the secret regions or China regions.

## Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

## Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

## Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239 1
      type: m5.4xlarge
      replicas: 3
  metadata:
    name: test-cluster
  platform:
    aws:
      region: us-gov-west-1 2
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'
```

- 1** The AMI ID from your AWS Marketplace subscription.
- 2** Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

### 4.10.10. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

## Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

- Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

- Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

#### 4.10.11. Manually creating the installation configuration file

When installing OpenShift Container Platform on Amazon Web Services (AWS) into a region requiring a custom Red Hat Enterprise Linux CoreOS (RHCOS) AMI, you must manually generate your installation configuration file.

##### Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

##### Procedure

- Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

**NOTE**

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 4.10.11.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

##### 4.10.11.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 4.32. Required parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.10.11.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.33. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 4.10.11.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.34. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="486 1093 593 1411" style="background-color: black; width: 67px; height: 142px; margin-bottom: 10px;"></div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 517 595 864" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <div data-bbox="485 913 595 1261" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background-color: black; margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey: &lt;key1&gt; &lt;key2&gt; &lt;key3&gt;</pre>

#### 4.10.11.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.35. Optional AWS parameters

Parameter	Description	Values
<b>compute.platform.aws.amiID</b>	The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>compute.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>compute.platform.aws.rootVolume.iops</b>	The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.	Integer, for example <b>4000</b> .
<b>compute.platform.aws.rootVolume.size</b>	The size in GiB of the root volume.	Integer, for example <b>500</b> .

Parameter	Description	Values
<b>compute.platform.aws.rootVolume.type</b>	The type of the root volume.	Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> .
<b>compute.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of worker nodes with a specific KMS key.	Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>
<b>compute.platform.aws.type</b>	The EC2 instance type for the compute machines.	Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>compute.platform.aws.zones</b>	The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>compute.aws.region</b>	The AWS region that the installation program creates compute resources in.	Any valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>controlPlane.platform.aws.amiID</b>	The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>controlPlane.platform.aws.iamRole</b>	A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role.	The name of a valid AWS IAM role.
<b>controlPlane.platform.aws.rootVolume.kmsKeyARN</b>	The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt OS volumes of control plane nodes with a specific KMS key.	Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>

Parameter	Description	Values
<b>controlPlane.platform.aws.type</b>	The EC2 instance type for the control plane machines.	Valid AWS instance type, such as <b>m5.xlarge</b> . See the <b>Instance types for machines</b> table that follows.
<b>controlPlane.platform.aws.zones</b>	The availability zones where the installation program creates machines for the control plane machine pool.	A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .
<b>controlPlane.aws.region</b>	The AWS region that the installation program creates control plane resources in.	Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .
<b>platform.aws.amiID</b>	The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.	Any published or custom RHCOS AMI that belongs to the set AWS region.
<b>platform.aws.hostedZone</b>	An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone.	String, for example <b>Z3URY6TWQ91KVV</b> .
<b>platform.aws.serviceEndpoints.name</b>	The AWS service endpoint name. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.	Valid <a href="#">AWS service endpoint</a> name.

Parameter	Description	Values
<b>platform.aws.serviceEndpoints.url</b>	The AWS service endpoint URL. The URL must use the <b>https</b> protocol and the host must trust the certificate.	Valid <a href="#">AWS service endpoint</a> URL.
<b>platform.aws.userTags</b>	A map of keys and values that the installation program adds as tags to all resources that it creates.	Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.
<b>platform.aws.subnets</b>	If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b>machineNetwork[].cidr</b> ranges that you specify. For a standard cluster, specify a public and a private subnet for each availability zone. For a private cluster, specify a private subnet for each availability zone.	Valid subnet IDs.

#### 4.10.11.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.36. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.10.11.3. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

**Example 4.20. Instance types for machines**

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x
<b>m6i.16xlarge</b>		x	x
<b>c4.2xlarge</b>		x	x
<b>c4.4xlarge</b>		x	x
<b>c4.8xlarge</b>		x	x
<b>c5.xlarge</b>			x
<b>c5.2xlarge</b>		x	x
<b>c5.4xlarge</b>		x	x
<b>c5.9xlarge</b>		x	x
<b>c5.12xlarge</b>		x	x
<b>c5.18xlarge</b>		x	x
<b>c5.24xlarge</b>		x	x
<b>c5a.xlarge</b>			x

Instance type	Bootstrap	Control plane	Compute
<b>c5a.2xlarge</b>		x	x
<b>c5a.4xlarge</b>		x	x
<b>c5a.8xlarge</b>		x	x
<b>c5a.12xlarge</b>		x	x
<b>c5a.16xlarge</b>		x	x
<b>c5a.24xlarge</b>		x	x
<b>r4.large</b>			x
<b>r4.xlarge</b>		x	x
<b>r4.2xlarge</b>		x	x
<b>r4.4xlarge</b>		x	x
<b>r4.8xlarge</b>		x	x
<b>r4.16xlarge</b>		x	x
<b>r5.large</b>			x
<b>r5.xlarge</b>		x	x
<b>r5.2xlarge</b>		x	x
<b>r5.4xlarge</b>		x	x
<b>r5.8xlarge</b>		x	x
<b>r5.12xlarge</b>		x	x
<b>r5.16xlarge</b>		x	x
<b>r5.24xlarge</b>		x	x
<b>r5a.large</b>			x
<b>r5a.xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>r5a.2xlarge</b>		x	x
<b>r5a.4xlarge</b>		x	x
<b>r5a.8xlarge</b>		x	x
<b>r5a.12xlarge</b>		x	x
<b>r5a.16xlarge</b>		x	x
<b>r5a.24xlarge</b>		x	x
<b>t3.large</b>			x
<b>t3.xlarge</b>			x
<b>t3.2xlarge</b>			x
<b>t3a.large</b>			x
<b>t3a.xlarge</b>			x
<b>t3a.2xlarge</b>			x

#### 4.10.11.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
name: master
platform:
  aws:
    zones:
      - us-gov-west-1a

```

```

- us-gov-west-1b
rootVolume:
  iops: 4000
  size: 500
  type: io1 6
  type: m5.xlarge
replicas: 3
compute: 7
- hyperthreading: Enabled 8
name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
      type: c5.4xlarge
    zones:
      - us-gov-west-1c
replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
networkType: OpenShiftSDN
serviceNetwork:
  - 172.30.0.0/16
platform:
  aws:
    region: us-gov-west-1 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: 12
    - subnet-1
    - subnet-2
    - subnet-3
    amiID: ami-96c6f8f7 13 14
    serviceEndpoints: 15
    - name: ec2
      url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
    hostedZone: Z3URY6TWQ91KVV 16
  fips: false 17
  sshKey: ssh-ed25519 AAAA... 18
  publish: Internal 19
  pullSecret: '{"auths": ...}' 20
  additionalTrustBundle: | 21
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----

```

- 1 10 11 13 20 Required.
- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.
- 3 7 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 14 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 15 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 16 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.
- 21 The custom CA certificate. This is required when deploying to the AWS C2S Top Secret Region because the AWS API requires a custom CA trust bundle.

#### 4.10.11.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

##### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

##### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
```

```

httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
noProxy: example.com 3
additionalTrustBundle: | 4
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.10.12. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

### 4.10.13. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### 4.10.14. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

##### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

##### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

##### Example output

```
system:admin
```

#### 4.10.15. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

##### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

##### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

- List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

**Example output**

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

- Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

**Additional resources**

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

**4.10.16. Telemetry access for OpenShift Container Platform**

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

**Additional resources**

- See [About remote health monitoring](#) for more information about the Telemetry service.

**4.10.17. Next steps**

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

**4.11. INSTALLING A CLUSTER ON AWS CHINA**

In OpenShift Container Platform version 4.9, you can install a cluster to the following Amazon Web Services (AWS) China regions:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

### 4.11.1. Prerequisites

- You have an Internet Content Provider (ICP) license.
- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

#### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

### 4.11.2. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) for the AWS China regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (**install-config.yaml**).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

### 4.11.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.11.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network.

### NOTE

AWS China does not support a VPN connection between the VPC and your network. For more information about the Amazon VPC service in the Beijing and Ningxia regions, see [Amazon Virtual Private Cloud](#) in the AWS China documentation.

#### 4.11.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

##### 4.11.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

#### 4.11.5. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

##### 4.11.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets

- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.\*: owned** tag. The installation program modifies your subnets to add the **kubernetes.io/cluster/.\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation. If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** field in the **install-config.yaml** file.
- If you use a cluster with public access, you must create a public and a private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2 and ELB endpoints. To resolve this, you must create a VPC endpoint and attach it to the subnet that the clusters are using. The endpoints should be named as follows:

- **ec2.<region>.amazonaws.com.cn**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

## Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description										
VPC	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::VPC</b></li> <li>● <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.										
Public subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.										
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.										
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkACL</b></li> <li>● <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic
Port	Reason											
<b>80</b>	Inbound HTTP traffic											
<b>443</b>	Inbound HTTPS traffic											
<b>22</b>	Inbound SSH traffic											
<b>1024 - 65535</b>	Inbound ephemeral traffic											

Component	AWS type	Description	
		<b>0 - 65535</b>	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

#### 4.11.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

#### 4.11.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program–provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking–related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 4.11.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 4.11.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 4.11.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

#### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

#### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

- 1 The AWS profile name that holds your AWS credentials, like **beijingadmin**.

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

- 1 The AWS region, like **cn-north-1**.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

- 1 The RHCOS VMDK version, like **4.9.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
```

```
"UserBucket": {
  "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
  "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
}
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" \ 1
  --disk-container "file://<file_path>/containers.json" 2
```

- 1** The description of your RHCOS disk being imported, like **rhcos-\${RHCOS\_VERSION}-x86\_64-aws.x86\_64**.
- 2** The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

### Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
```

```

--ena-support \
--name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❸
--virtualization-type hvm \
--root-device-name '/dev/xvda' \
--block-device-mappings 'DeviceName=/dev/xvda,Ebs=
{DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' ❹

```

- ❶ The RHCOS VMDK architecture type, like **x86\_64**, **s390x**, or **ppc64le**.
- ❷ The **Description** from the imported snapshot.
- ❸ The name of the RHCOS AMI.
- ❹ The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

### 4.11.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

—

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.11.9. Manually creating the installation configuration file

When installing OpenShift Container Platform on Amazon Web Services (AWS) into a region requiring a custom Red Hat Enterprise Linux CoreOS (RHCOS) AMI, you must manually generate your installation configuration file.

#### Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

### 4.11.9.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 4.11.9.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.37. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> , <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object

Parameter	Description	Values
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 4.11.9.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 4.38. Network parameters**

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

#### 4.11.9.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 4.39. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<p><b>credentialsMode</b></p>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="486 510 595 862" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p> <div data-bbox="486 907 595 1258" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<p><b>Mint, Passthrough, Manual</b> or an empty string ("").</p>

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . The default value is <b>External</b> .  Setting this field to <b>Internal</b> is not supported on non-cloud platforms.

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 4.11.9.2. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
hyperthreading: Enabled 5
name: master
platform:
  aws:
    zones:
      - cn-north-1a
      - cn-north-1b
    rootVolume:
      iops: 4000
      size: 500
      type: io1 6
      type: m5.xlarge
    replicas: 3
  compute: 7
  - hyperthreading: Enabled 8
```

```

name: worker
platform:
  aws:
    rootVolume:
      iops: 2000
      size: 500
      type: io1 9
    type: c5.4xlarge
    zones:
      - cn-north-1a
  replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: cn-north-1 11
    userTags:
      adminContact: jdoe
      costCenter: 7536
    subnets: 12
      - subnet-1
      - subnet-2
      - subnet-3
    amiID: ami-96c6f8f7 13 14
    serviceEndpoints: 15
      - name: ec2
        url: https://vpce-id.ec2.cn-north-1.vpce.amazonaws.com.cn
    hostedZone: Z3URY6TWQ91KVV 16
  fips: false 17
  sshKey: ssh-ed25519 AAAA... 18
  publish: Internal 19
  pullSecret: '{"auths": ...}' 20

```

**1** **10** **11** **13** **20** Required.

**2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode, instead of having the CCO dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the *Cloud Credential Operator* entry in the *Platform Operators reference* content.

**3** **7** If you do not provide these parameters and values, the installation program provides the default value.

**4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one

control plane pool is used.

- 5 8 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 9 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 12 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 14 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 15 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 16 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 4.11.9.3. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.40. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.11.9.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

**Example 4.21. Instance types for machines**

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x
<b>m6i.16xlarge</b>		x	x
<b>c4.2xlarge</b>		x	x
<b>c4.4xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>c4.8xlarge</b>		x	x
<b>c5.xlarge</b>			x
<b>c5.2xlarge</b>		x	x
<b>c5.4xlarge</b>		x	x
<b>c5.9xlarge</b>		x	x
<b>c5.12xlarge</b>		x	x
<b>c5.18xlarge</b>		x	x
<b>c5.24xlarge</b>		x	x
<b>c5a.xlarge</b>			x
<b>c5a.2xlarge</b>		x	x
<b>c5a.4xlarge</b>		x	x
<b>c5a.8xlarge</b>		x	x
<b>c5a.12xlarge</b>		x	x
<b>c5a.16xlarge</b>		x	x
<b>c5a.24xlarge</b>		x	x
<b>r4.large</b>			x
<b>r4.xlarge</b>		x	x
<b>r4.2xlarge</b>		x	x
<b>r4.4xlarge</b>		x	x
<b>r4.8xlarge</b>		x	x

#### 4.11.9.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

## Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com.cn**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network

- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 4.11.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

**NOTE**

The cluster access and credential information also outputs to **<installation\_directory>/.openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

**NOTE**

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

#### 4.11.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.

5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.11.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.11.13. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

### 4.11.14. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.11.15. Next steps

- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

## 4.12. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

In OpenShift Container Platform version 4.9, you can install a cluster on Amazon Web Services (AWS) that uses infrastructure that you provide.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 4.12.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or UNIX\)](#) in the AWS documentation.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

### NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## 4.12.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 4.12.3. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

### 4.12.3.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 4.41. Minimum required hosts**

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

### IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 7.9, or RHEL 8.4.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

#### 4.12.3.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.42. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.12.3.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

#### 4.12.3.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.22. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x
<b>m6i.16xlarge</b>		x	x
<b>c4.2xlarge</b>		x	x
<b>c4.4xlarge</b>		x	x
<b>c4.8xlarge</b>		x	x
<b>c5.xlarge</b>			x
<b>c5.2xlarge</b>		x	x
<b>c5.4xlarge</b>		x	x
<b>c5.9xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>c5.12xlarge</b>		x	x
<b>c5.18xlarge</b>		x	x
<b>c5.24xlarge</b>		x	x
<b>c5a.xlarge</b>			x
<b>c5a.2xlarge</b>		x	x
<b>c5a.4xlarge</b>		x	x
<b>c5a.8xlarge</b>		x	x
<b>c5a.12xlarge</b>		x	x
<b>c5a.16xlarge</b>		x	x
<b>c5a.24xlarge</b>		x	x
<b>r4.large</b>			x
<b>r4.xlarge</b>		x	x
<b>r4.2xlarge</b>		x	x
<b>r4.4xlarge</b>		x	x
<b>r4.8xlarge</b>		x	x
<b>r4.16xlarge</b>		x	x
<b>r5.large</b>			x
<b>r5.xlarge</b>		x	x
<b>r5.2xlarge</b>		x	x
<b>r5.4xlarge</b>		x	x
<b>r5.8xlarge</b>		x	x
<b>r5.12xlarge</b>		x	x
<b>r5.16xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>r5.24xlarge</b>		x	x
<b>r5a.large</b>			x
<b>r5a.xlarge</b>		x	x
<b>r5a.2xlarge</b>		x	x
<b>r5a.4xlarge</b>		x	x
<b>r5a.8xlarge</b>		x	x
<b>r5a.12xlarge</b>		x	x
<b>r5a.16xlarge</b>		x	x
<b>r5a.24xlarge</b>		x	x
<b>t3.large</b>			x
<b>t3.xlarge</b>			x
<b>t3.2xlarge</b>			x
<b>t3a.large</b>			x
<b>t3a.xlarge</b>			x
<b>t3a.2xlarge</b>			x

#### 4.12.4. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles

- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

#### 4.12.4.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

#### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkAcl</b></li> <li>● <b>AWS::EC2::NetworkAclEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>												

### Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api**.

`<cluster_name>.<domain>` must point to the external load balancer, and an entry for `api-int.<cluster_name>.<domain>` must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	<b>AWS::Route53::HostedZone</b>	The hosted zone for your internal DNS.
etcd record sets	<b>AWS::Route53::RecordSet</b>	The registration records for etcd for your control plane machines.
Public load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your public subnets.
External API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the external API server.
External listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the external load balancer.
External target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the external load balancer.
Private load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your private subnets.
Internal API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the internal API server.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 22623 for the internal load balancer.

Component	AWS type	Description
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.

## Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
<b>MasterSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>6443</b>
		<b>tcp</b>	<b>22623</b>
<b>WorkerSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
<b>BootstrapSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>19531</b>

## Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>MasterIngressEtcd</b>	etcd	<b>tcp</b>	<b>2379- 2380</b>

Ingress group	Description	IP protocol	Port range
<b>MasterIngress Vxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>MasterIngress WorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>MasterIngress Internal</b>	Internal cluster communication and Kubernetes proxy metrics	<b>tcp</b>	<b>9000 - 9999</b>
<b>MasterIngress WorkerIntern al</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>MasterIngress Kube</b>	Kubernetes kubelet, scheduler and controller manager	<b>tcp</b>	<b>10250 - 10259</b>
<b>MasterIngress WorkerKube</b>	Kubernetes kubelet, scheduler and controller manager	<b>tcp</b>	<b>10250 - 10259</b>
<b>MasterIngress IngressServic es</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>MasterIngress WorkerIngress Services</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>MasterIngress Geneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>MasterIngress WorkerGenev e</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>MasterIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress WorkerIpsecIk e</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>MasterIngress WorkerIpsecN at</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>

Ingress group	Description	IP protocol	Port range
<b>MasterIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress WorkerIpsecE sp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress WorkerInterna IUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress IngressServic esUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>MasterIngress WorkerIngress ServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress Vxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress WorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress Internal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress WorkerInterna I</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress Kube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress WorkerKube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress IngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress WorkerIngress Services</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress Geneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress MasterGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress MasterIpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>WorkerIngress MasterIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>WorkerIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress MasterIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress MasterInternal UDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress IngressServices UDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress MasterIngress ServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

### Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	<b>Allow</b>	<b>ec2:*</b>	*
	<b>Allow</b>	<b>elasticloadbalancing:*</b>	*
	<b>Allow</b>	<b>iam:PassRole</b>	*
	<b>Allow</b>	<b>s3:GetObject</b>	*
Worker	<b>Allow</b>	<b>ec2:Describe*</b>	*
Bootstrap	<b>Allow</b>	<b>ec2:Describe*</b>	*
	<b>Allow</b>	<b>ec2:AttachVolume</b>	*
	<b>Allow</b>	<b>ec2:DetachVolume</b>	*

#### 4.12.4.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

#### 4.12.4.3. Required AWS permissions for the IAM user

**NOTE**

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 4.23. Required EC2 permissions for installation**

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**

- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.24. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**

- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

**Example 4.25. Required Elastic Load Balancing permissions (ELB) for installation**

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

**Example 4.26. Required Elastic Load Balancing permissions (ELBv2) for installation**

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

**Example 4.27. Required IAM permissions for installation**

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam>DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**

- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

#### NOTE

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

#### Example 4.28. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

#### Example 4.29. Required S3 permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**

- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.30. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.31. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**

- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:ListAttachedRolePolicies**
- **iam:ListInstanceProfiles**
- **iam:ListRolePolicies**
- **iam:ListUserPolicies**
- **s3:DeleteObject**
- **s3:ListBucketVersions**
- **tag:GetResources**

Example 4.32. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**
- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

**Example 4.33. Required permissions to delete a cluster with shared instance roles**

- **iam:UntagRole**

**Example 4.34. Additional IAM and S3 permissions that are required to create manifests**

- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3:ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 4.35. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

#### 4.12.5. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

**NOTE**

Deploying an OpenShift Container Platform cluster using an AWS Marketplace image is not supported in the secret regions or China regions.

**Prerequisites**

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

**Procedure**

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. If you use the CloudFormation template to deploy your worker nodes, you must update the **worker0.type.properties.ImageID** parameter with this value.

**4.12.6. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

- Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

#### 4.12.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the `core` user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user `core`. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

- If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the `x86_64` architecture, do not create a key that uses the `ed25519` algorithm. Instead, create a key that uses the `rsa` or `ecdsa` algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

### 4.12.8. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and

customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

#### 4.12.8.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

#### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

#### Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

#### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

- Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

- Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
      partitions:
        - label: var
          start_mib: <partition_start_offset> 2
          size_mib: <partition_size> 3
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] 4
          with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

**NOTE**

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

#### 4.12.8.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

##### Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

##### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

## IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

## NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

## NOTE

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Optional: Back up the **install-config.yaml** file.

## IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

### 4.12.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

#### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

**1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

**2** A proxy URL to use for creating HTTPS connections outside the cluster.

- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 4.12.8.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

## Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** file.
- b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
- c. Save and exit the file.

5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the **<installation\_directory>/manifests/cluster-dns-02-config.yml** DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
  id: mycluster-100419-private-zone
```

```
publicZone: 2
  id: example.openshift.com
  status: {}
```

1 2 Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

- To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

1 For **<installation\_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation\_directory>/auth** directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

#### 4.12.9. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

##### Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

##### Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

### Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

## 4.12.10. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "VpcCidr", 1
    "ParameterValue": "10.0.0.0/16" 2
  },
  {
    "ParameterKey": "AvailabilityZoneCount", 3
    "ParameterValue": "1" 4
  },
  {
    "ParameterKey": "SubnetBits", 5
    "ParameterValue": "12" 6
  }
]
```

- 1 The CIDR block for the VPC.
  - 2 Specify a CIDR block in the format **x.x.x.x/16-24**.
  - 3 The number of availability zones to deploy the VPC in.
  - 4 Specify an integer between **1** and **3**.
  - 5 The size of each subnet in each availability zone.
  - 6 Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.
2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>VpcId</b>	The ID of your VPC.
--------------	---------------------

<b>PublicSubnetIds</b>	The IDs of the new public subnets.
<b>PrivateSubnetIds</b>	The IDs of the new private subnets.

#### 4.12.10.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

##### Example 4.36. CloudFormation template for the VPC

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5]).){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\.(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
    Default: 1
    Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
    Type: Number
  SubnetBits:
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
    MinValue: 5
    MaxValue: 13
    Default: 12
    Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
    Type: Number

Metadata:
  AWS::CloudFormation::Interface:
    ParameterGroups:
      - Label:
          default: "Network Configuration"
        Parameters:
          - VpcCidr
          - SubnetBits
      - Label:
          default: "Availability Zones"
        Parameters:
          - AvailabilityZoneCount
    ParameterLabels:

]

```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

### 4.12.11. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1 For the **<route53\_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

## Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  },
  {
    "ParameterKey": "InfrastructureName", 3
    "ParameterValue": "mycluster-<random_string>" 4
  },
  {
    "ParameterKey": "HostedZoneId", 5
    "ParameterValue": "<random_string>" 6
  },
  {
    "ParameterKey": "HostedZoneName", 7
    "ParameterValue": "example.com" 8
  },
  {
    "ParameterKey": "PublicSubnets", 9
    "ParameterValue": "subnet-<random_string>" 10
  },
  {
```

```

    "ParameterKey": "PrivateSubnets", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "VpcId", 13
    "ParameterValue": "vpc-<random_string>" 14
  }
]

```

- 1** A short, representative cluster name to use for hostnames, etc.
  - 2** Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
  - 3** The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 4** Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 5** The Route 53 public zone ID to register the targets with.
  - 6** Specify the Route 53 public zone ID, which as a format similar to **Z21IXYZABCZ2A4**. You can obtain this value from the AWS console.
  - 7** The Route 53 zone to register the targets with.
  - 8** Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
  - 9** The public subnets that you created for your VPC.
  - 10** Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 11** The private subnets that you created for your VPC.
  - 12** Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 13** The VPC that you created for the cluster.
  - 14** Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

### IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

- Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4** You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>PrivateHostedZoneId</b>	Hosted zone ID for the private DNS.
<b>ExternalApiLoadBalancerName</b>	Full name of the external API load balancer.
<b>InternalApiLoadBalancerName</b>	Full name of the internal API load balancer.

<b>ApiServer DnsName</b>	Full hostname of the API server.
<b>RegisterN IbIpTarget sLambda</b>	Lambda ARN useful to help register/deregister IP targets for these load balancers.
<b>ExternalA piTargetG roupArn</b>	ARN of external API target group.
<b>InternalAp iTargetGr oupArn</b>	ARN of internal API target group.
<b>InternalSe rviceTarg etGroupA rn</b>	ARN of internal service target group.

#### 4.12.11.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

##### Example 4.37. CloudFormation template for the network and load balancers

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
  ClusterName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, representative cluster name to use for host names and other identifying
    names.
    Type: String
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\-]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
    maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
    used by the cluster.
    Type: String
  HostedZoneId:
    Description: The Route53 public zone ID to register the targets with, such as

```

Z21XYZABCZ2A4.

Type: String

HostedZoneName:

Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.

Type: String

Default: "example.com"

PublicSubnets:

Description: The internet-facing subnets.

Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:

Description: The internal subnets.

Type: List<AWS::EC2::Subnet::Id>

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: AWS::EC2::VPC::Id

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- ClusterName

- InfrastructureName

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- PublicSubnets

- PrivateSubnets

- Label:

default: "DNS"

Parameters:

- HostedZoneName

- HostedZoneId

ParameterLabels:

ClusterName:

default: "Cluster Name"

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

PublicSubnets:

default: "Public Subnets"

PrivateSubnets:

default: "Private Subnets"

HostedZoneName:

default: "Public Hosted Zone Name"

HostedZoneId:

default: "Public Hosted Zone ID"

Resources:

ExtApiElb:

Type: AWS::ElasticLoadBalancingV2::LoadBalancer

Properties:

```
Name: !Join ["-", [!Ref InfrastructureName, "ext"]]
IpAddressType: ipv4
Subnets: !Ref PublicSubnets
Type: network
```

#### IntApiElb:

```
Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:

#### RegisterPublicSubnetTags:

Type: Custom::SubnetRegister

##### Properties:

ServiceToken: !GetAtt RegisterSubnetTags.Arn

InfrastructureName: !Ref InfrastructureName

Subnets: !Ref PublicSubnets

#### RegisterPrivateSubnetTags:

Type: Custom::SubnetRegister

##### Properties:

ServiceToken: !GetAtt RegisterSubnetTags.Arn

InfrastructureName: !Ref InfrastructureName

Subnets: !Ref PrivateSubnets

#### Outputs:

##### PrivateHostedZoneId:

Description: Hosted zone ID for the private DNS, which is required for private records.

Value: !Ref IntDns

##### ExternalApiLoadBalancerName:

Description: Full name of the external API load balancer.

Value: !GetAtt ExtApiElb.LoadBalancerFullName

##### InternalApiLoadBalancerName:

Description: Full name of the internal API load balancer.

Value: !GetAtt IntApiElb.LoadBalancerFullName

##### ApiServerDnsName:

Description: Full hostname of the API server, which is required for the Ignition config files.

Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]

##### RegisterNlbIpTargetsLambda:

Description: Lambda ARN useful to help register or deregister IP targets for these load balancers.

Value: !GetAtt RegisterNlbIpTargets.Arn

##### ExternalApiTargetGroupArn:

Description: ARN of the external API target group.

Value: !Ref ExternalApiTargetGroup

##### InternalApiTargetGroupArn:

Description: ARN of the internal API target group.

Value: !Ref InternalApiTargetGroup

##### InternalServiceTargetGroupArn:

Description: ARN of the internal service target group.

Value: !Ref InternalServiceTargetGroup

## IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- You can view details about your hosted zones by navigating to the [AWS Route 53 console](#).
- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

## 4.12.12. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
{
  "ParameterKey": "InfrastructureName", 1
```

```

    "ParameterValue": "mycluster-<random_string>" ❷
  },
  {
    "ParameterKey": "VpcCidr", ❸
    "ParameterValue": "10.0.0.0/16" ❹
  },
  {
    "ParameterKey": "PrivateSubnets", ❺
    "ParameterValue": "subnet-<random_string>" ❻
  },
  {
    "ParameterKey": "VpcId", ❼
    "ParameterValue": "vpc-<random_string>" ❽
  }
]

```

- ❶ The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - ❷ Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - ❸ The CIDR block for the VPC.
  - ❹ Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
  - ❺ The private subnets that you created for your VPC.
  - ❻ Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - ❼ The VPC that you created for the cluster.
  - ❽ Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
2. Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

### IMPORTANT

You must enter the command on a single line.

```

$ aws cloudformation create-stack --stack-name <name> ❶
  --template-body file://<template>.yaml ❷
  --parameters file://<parameters>.json ❸
  --capabilities CAPABILITY_NAMED_IAM ❹

```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>MasterSecurityGroupID</b>	Master Security Group ID
<b>WorkerSecurityGroupID</b>	Worker Security Group ID
<b>MasterInstanceProfile</b>	Master IAM Instance Profile
<b>WorkerInstanceProfile</b>	Worker IAM Instance Profile

#### 4.12.12.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

##### Example 4.38. CloudFormation template for security objects

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)
```

## Parameters:

## InfrastructureName:

AllowedPattern: `^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$`

MaxLength: `27`

MinLength: `1`

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of `27` characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

## VpcCidr:

AllowedPattern: `^(((0-9){1-9}|0-9)|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.\.){3}((0-9){1-9}|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.(1[6-9]|2[0-4])$`

ConstraintDescription: CIDR block parameter must be in the form `x.x.x.x/16-24`.

Default: `10.0.0.0/16`

Description: CIDR block for VPC.

Type: String

## VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: `AWS::EC2::VPC::Id`

## PrivateSubnets:

Description: The internal subnets.

Type: `List<AWS::EC2::Subnet::Id>`

## Metadata:

## AWS::CloudFormation::Interface:

## ParameterGroups:

## - Label:

default: `"Cluster Information"`

## Parameters:

- InfrastructureName

## - Label:

default: `"Network Configuration"`

## Parameters:

- VpcId

- VpcCidr

- PrivateSubnets

## ParameterLabels:

## InfrastructureName:

default: `"Infrastructure Name"`

## VpcId:

default: `"VPC ID"`

## VpcCidr:

default: `"VPC CIDR"`

## PrivateSubnets:

default: `"Private Subnets"`

## Resources:

## MasterSecurityGroup:

Type: `AWS::EC2::SecurityGroup`

## Properties:

GroupDescription: Cluster Master Security Group

## SecurityGroupIngress:

- IpProtocol: `icmp`

FromPort: `0`

ToPort: 0  
 CidrIp: !Ref VpcCidr  
 - IpProtocol: tcp

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

### 4.12.13. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

## Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
  - Print the current **x86\_64** AMI for an AWS region, such as **us-west-1**:

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

### Example output

```
ami-0d3e625f84626bbda
```

The output of this command is the AWS AMI ID for the **us-west-1** region. The AMI must belong to the same region as the cluster.

## 4.12.14. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions that you can manually specify for your OpenShift Container Platform nodes.

### NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 4.43. RHCOS AMIs

AWS zone	AWS AMI
<b>af-south-1</b>	<b>ami-0f3804f5a2f913dcc</b>
<b>ap-east-1</b>	<b>ami-0de1febb30a83da66</b>

<b>us-west-2</b>	<b>ami-084fb1316cd1ed4cc</b>

#### 4.12.14.1. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you can upload a custom AMI prior to installing the cluster.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the **us-east-1** AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the **install-config.yaml** file.

#### 4.12.14.2. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

##### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

##### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

1 1 1 The RHCOS VMDK version, like **4.9.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
    "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" \ ❶
  --disk-container "file://<file_path>/containers.json" ❷
```

- ❶ The description of your RHCOS disk being imported, like **rhcos-\${RHCOS\_VERSION}-x86\_64-aws.x86\_64**.
- ❷ The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

### Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ ❶
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❷
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❸
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs=
  {DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' ❹
```

- ❶ The RHCOS VMDK architecture type, like **x86\_64**, **s390x**, or **ppc64le**.

- 2 The **Description** from the imported snapshot.
- 3 The name of the RHCOS AMI.
- 4 The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

#### 4.12.15. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

#### NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

#### Procedure

1. Provide a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster's region and upload the Ignition config file to it.

#### IMPORTANT

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

## IMPORTANT

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the **s3://** schema.

## NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

- a. Create the bucket:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1** **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

- b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-  
infra/bootstrap.ign 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

### Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[  
  {  
    "ParameterKey": "InfrastructureName", 1  
    "ParameterValue": "mycluster-<random_string>" 2  
  },  
  {  
    "ParameterKey": "RhcosAmi", 3  
    "ParameterValue": "ami-<random_string>" 4  
  },  
  {  
    "ParameterKey": "AllowedBootstrapSshCidr", 5
```

```

    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroup", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcId", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  },
  {
    "ParameterKey": "RegisterNlbTargetsLambdaArn", 17
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 18
  },
  {
    "ParameterKey": "ExternalApiTargetGroupArn", 19
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
  },
  {
    "ParameterKey": "InternalApiTargetGroupArn", 21
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 23
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
  }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.
- 4 Specify a valid **AWS::EC2::Image::Id** value.

- 5 CIDR block to allow SSH access to the bootstrap node.
  - 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
  - 7 The public subnet that is associated with your VPC to launch the bootstrap node into.
  - 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 9 The master security group ID (for registering temporary rules)
  - 10 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
  - 11 The VPC created resources will belong to.
  - 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
  - 13 Location to fetch bootstrap Ignition config file from.
  - 14 Specify the S3 bucket and file name in the form **s3://<bucket\_name>/bootstrap.ign**.
  - 15 Whether or not to register a network load balancer (NLB).
  - 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
  - 17 The ARN for NLB IP target registration lambda group.
  - 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 19 The ARN for external API load balancer target group.
  - 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 21 The ARN for internal API load balancer target group.
  - 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 23 The ARN for internal service load balancer target group.
  - 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
3. Copy the template from the **CloudFormation template for the bootstrap machines** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
  4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

## IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>Bootstrap Instanceld</b>	The bootstrap Instance ID.
<b>Bootstrap PublicIp</b>	The bootstrap node public IP address.
<b>Bootstrap PrivateIp</b>	The bootstrap node private IP address.

#### 4.12.15.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

#### Example 4.39. CloudFormation template for the bootstrap machine

■

AWSTemplateFormatVersion: [2010-09-09](#)

Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:

InfrastructureName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: [27](#)

MinLength: [1](#)

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of [27](#) characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: `AWS::EC2::Image::Id`

AllowedBootstrapSshCidr:

AllowedPattern: `^((([0-9]{1-9}|[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]{1-9}|[0-9]{2}|2[0-4][0-9]|25[0-5])|([0-9]{1-9}|2[0-9]|3[0-2]))$`

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.

Default: [0.0.0.0/0](#)

Description: CIDR block to allow SSH access to the bootstrap node.

Type: String

PublicSubnet:

Description: The public subnet to launch the bootstrap node into.

Type: `AWS::EC2::Subnet::Id`

MasterSecurityGroupId:

Description: The master security group ID for registering temporary rules.

Type: `AWS::EC2::SecurityGroup::Id`

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: `AWS::EC2::VPC::Id`

BootstrapIgnitionLocation:

Default: `s3://my-s3-bucket/bootstrap.ign`

Description: Ignition config file location.

Type: String

AutoRegisterELB:

Default: `"yes"`

AllowedValues:

- `"yes"`

- `"no"`

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group.

Type: String

```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

## 4.12.16. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

### IMPORTANT

The CloudFormation template creates a stack that represents three control plane nodes.

### NOTE

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcocAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZoneId", 7
    "ParameterValue": "<random_string>" 8
  }
]
```

```

},
{
  "ParameterKey": "PrivateHostedZoneName", 9
  "ParameterValue": "mycluster.example.com" 10
},
{
  "ParameterKey": "Master0Subnet", 11
  "ParameterValue": "subnet-<random_string>" 12
},
{
  "ParameterKey": "Master1Subnet", 13
  "ParameterValue": "subnet-<random_string>" 14
},
{
  "ParameterKey": "Master2Subnet", 15
  "ParameterValue": "subnet-<random_string>" 16
},
{
  "ParameterKey": "MasterSecurityGroupID", 17
  "ParameterValue": "sg-<random_string>" 18
},
{
  "ParameterKey": "IgnitionLocation", 19
  "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
20
},
{
  "ParameterKey": "CertificateAuthorities", 21
  "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
},
{
  "ParameterKey": "MasterInstanceProfileName", 23
  "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
},
{
  "ParameterKey": "MasterInstanceType", 25
  "ParameterValue": "m5.xlarge" 26
},
{
  "ParameterKey": "AutoRegisterELB", 27
  "ParameterValue": "yes" 28
},
{
  "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
  "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
},
{
  "ParameterKey": "ExternalApiTargetGroupArn", 31
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
},
{

```

```

    "ParameterKey": "InternalApiTargetGroupArn", 33
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
  },
  {
    "ParameterKey": "InternalServiceTargetGroupArn", 35
    "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
  }
]

```

- 1** The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2** Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3** Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
- 4** Specify an **AWS::EC2::Image::Id** value.
- 5** Whether or not to perform DNS etcd registration.
- 6** Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7** The Route 53 private zone ID to register the etcd targets with.
- 8** Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9** The Route 53 zone to register the targets with.
- 10** Specify **<cluster\_name>.<domain\_name>** where **<domain\_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 11 13 15** A subnet, preferably private, to launch the control plane machines on.
- 12 14 16** Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17** The master security group ID to associate with control plane nodes.
- 18** Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 19** The location to fetch control plane Ignition config file from.
- 20** Specify the generated Ignition config file location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/master](https://api-int.<cluster_name>.<domain_name>:22623/config/master).
- 21** The base64 encoded certificate authority string to use.
- 22** Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.

- 23 The IAM profile to associate with control plane nodes.
- 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 25 The type of AWS instance to use for the control plane machines.
- 26 Allowed values:
  - **m4.xlarge**
  - **m4.2xlarge**
  - **m4.4xlarge**
  - **m4.10xlarge**
  - **m4.16xlarge**
  - **m5.xlarge**
  - **m5.2xlarge**
  - **m5.4xlarge**
  - **m5.8xlarge**
  - **m5.12xlarge**
  - **m5.16xlarge**
  - **m5a.xlarge**
  - **m5a.2xlarge**
  - **m5a.4xlarge**
  - **m5a.8xlarge**
  - **m5a.12xlarge**
  - **m5a.16xlarge**
  - **c4.2xlarge**
  - **c4.4xlarge**
  - **c4.8xlarge**
  - **c5.2xlarge**
  - **c5.4xlarge**
  - **c5.9xlarge**
  - **c5.12xlarge**
  - **c5.18xlarge**

- **c5.24xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**
- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**
- **r5.24xlarge**
- **r5a.xlarge**
- **r5a.2xlarge**
- **r5a.4xlarge**
- **r5a.8xlarge**
- **r5a.12xlarge**
- **r5a.16xlarge**
- **r5a.24xlarge**

- 27 Whether or not to register a network load balancer (NLB).
- 28 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 29 The ARN for NLB IP target registration lambda group.

- 30 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an
  - 31 The ARN for external API load balancer target group.
  - 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 33 The ARN for internal API load balancer target group.
  - 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 35 The ARN for internal service load balancer target group.
  - 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
  3. If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
  4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

**NOTE**

The CloudFormation template creates a stack that represents three control plane nodes.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

#### 4.12.16.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

##### Example 4.40. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
maximum of 27 characters.
    Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AutoRegisterDNS:
    Default: "yes"
    AllowedValues:
      - "yes"
      - "no"
    Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone
information?
    Type: String
  PrivateHostedZoneId:
    Description: The Route53 private zone ID to register the etcd targets with, such as
Z21IXYZABCZ2A4.
    Type: String
  PrivateHostedZoneName:
    Description: The Route53 zone to register the targets with, such as cluster.example.com. Omit
the trailing period.
    Type: String
  Master0Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  Master1Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
    Type: AWS::EC2::Subnet::Id
  Master2Subnet:
    Description: The subnets, recommend private, to launch the master nodes into.
```

Type: AWS::EC2::Subnet::Id

MasterSecurityGroupId:  
Description: The master security group ID to associate with master nodes.  
Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:  
Default: `https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master`  
Description: Ignition config file location.  
Type: String

CertificateAuthorities:  
Default: `data:text/plain;charset=utf-8;base64,ABC...xYz==`  
Description: Base64 encoded certificate authority string to use.  
Type: String

MasterInstanceProfileName:  
Description: IAM profile to associate with master nodes.  
Type: String

MasterInstanceType:  
Default: `m5.xlarge`  
Type: String

AutoRegisterELB:  
Default: `"yes"`  
AllowedValues:  
- `"yes"`  
- `"no"`  
Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?  
Type: String

RegisterNlbTargetsLambdaArn:  
Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select `"no"` for AutoRegisterELB.  
Type: String

ExternalApiTargetGroupArn:  
Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select `"no"` for AutoRegisterELB.  
Type: String

InternalApiTargetGroupArn:  
Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select `"no"` for AutoRegisterELB.  
Type: String

InternalServiceTargetGroupArn:  
Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select `"no"` for AutoRegisterELB.  
Type: String

Metadata:

AWS::CloudFormation::Interface:  
ParameterGroups:  
- Label:  
  default: `"Cluster Information"`

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

## 4.12.17. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

### IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

### NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

### Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
```

```

{
  "ParameterKey": "InfrastructureName", 1
  "ParameterValue": "mycluster-<random_string>" 2
},
{
  "ParameterKey": "RhcocAmi", 3
  "ParameterValue": "ami-<random_string>" 4
},
{
  "ParameterKey": "Subnet", 5
  "ParameterValue": "subnet-<random_string>" 6
},
{
  "ParameterKey": "WorkerSecurityGroupID", 7
  "ParameterValue": "sg-<random_string>" 8
},
{
  "ParameterKey": "IgnitionLocation", 9
  "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
10
},
{
  "ParameterKey": "CertificateAuthorities", 11
  "ParameterValue": "" 12
},
{
  "ParameterKey": "WorkerInstanceProfileName", 13
  "ParameterValue": "" 14
},
{
  "ParameterKey": "WorkerInstanceType", 15
  "ParameterValue": "m4.2xlarge" 16
}
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 A subnet, preferably private, to start the worker nodes on.
- 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 7 The worker security group ID to associate with worker nodes.
- 8 Specify the **WorkerSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.

- 9 The location to fetch the bootstrap Ignition config file from.
- 10 Specify the generated Ignition config location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/worker](https://api-int.<cluster_name>.<domain_name>:22623/config/worker).
- 11 Base64 encoded certificate authority string to use.
- 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 13 The IAM profile to associate with worker nodes.
- 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 15 The type of AWS instance to use for the control plane machines.
- 16 Allowed values:
  - **m4.large**
  - **m4.xlarge**
  - **m4.2xlarge**
  - **m4.4xlarge**
  - **m4.10xlarge**
  - **m4.16xlarge**
  - **m5.large**
  - **m5.xlarge**
  - **m5.2xlarge**
  - **m5.4xlarge**
  - **m5.8xlarge**
  - **m5.12xlarge**
  - **m5.16xlarge**
  - **m5a.large**
  - **m5a.xlarge**
  - **m5a.2xlarge**
  - **m5a.4xlarge**
  - **m5a.8xlarge**
  - **m5a.12xlarge**
  - **m5a.16xlarge**

- **c4.large**
- **c4.xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.large**
- **c5.xlarge**
- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**
- **c5a.large**
- **c5a.xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**
- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.large**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.large**
- **r5.xlarge**

- **r5.2xlarge**
  - **r5.4xlarge**
  - **r5.8xlarge**
  - **r5.12xlarge**
  - **r5.16xlarge**
  - **r5.24xlarge**
  - **r5a.large**
  - **r5a.xlarge**
  - **r5a.2xlarge**
  - **r5a.4xlarge**
  - **r5a.8xlarge**
  - **r5a.12xlarge**
  - **r5a.16xlarge**
  - **r5a.24xlarge**
  - **t3.large**
  - **t3.xlarge**
  - **t3.2xlarge**
  - **t3a.large**
  - **t3a.xlarge**
  - **t3a.2xlarge**
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.
  3. Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
  4. Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
  5. Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml \ 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

**NOTE**

The CloudFormation template creates a stack that represents one worker node.

6. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

7. Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

**4.12.17.1. CloudFormation template for worker machines**

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

**Example 4.41. CloudFormation template for worker machines**

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
  InfrastructureName:
```

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\]{0,26})\$

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: AWS::EC2::Image::Id

Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

WorkerSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:

Default: https://api-int.\$CLUSTER\_NAME.\$DOMAIN:22623/config/worker

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: data:text/plain;charset=utf-8;base64,ABC...xYz==

Description: Base64 encoded certificate authority string to use.

Type: String

WorkerInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

WorkerInstanceType:

Default: m5.large

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- WorkerInstanceType

- RhcosAmi

- IgnitionLocation

- CertificateAuthorities

- WorkerSecurityGroupId

- WorkerInstanceProfileName

- Label:

default: "Network Configuration"

Parameters:

- Subnet

ParameterLabels:

Subnet:

default: "Subnet"

InfrastructureName:

default: "Infrastructure Name"

```

WorkerInstanceType:
  default: "Worker Instance Type"
WorkerInstanceProfileName:
  default: "Worker Instance Profile Name"
RhcocAmi:
  default: "Red Hat Enterprise Linux CoreOS AMI ID"
IgnitionLocation:
  default: "Worker Ignition Source"
CertificateAuthorities:
  default: "Ignition CA String"
WorkerSecurityGroupId:
  default: "Worker Security Group ID"

Resources:
Worker0:
  Type: AWS::EC2::Instance
  Properties:
    ImageId: !Ref RhcocAmi
    BlockDeviceMappings:
      - DeviceName: /dev/xvda
        Ebs:

          VolumeType: "gp2"
    IamInstanceProfile: !Ref WorkerInstanceProfileName
    InstanceType: !Ref WorkerInstanceType
    NetworkInterfaces:
      - AssociatePublicIp: "false"
        DeviceIndex: "0"
        GroupSet:
          - !Ref "WorkerSecurityGroupId"
        SubnetId: !Ref "Subnet"
    UserData:
      Fn::Base64: !Sub
        - '{"ignition":{"config":{"merge":[{"source":"${SOURCE}"}]},"security":{"tls":
{"certificateAuthorities":[{"source":"${CA_BUNDLE}"}]},"version":"3.1.0"}}'
        - {
          SOURCE: !Ref IgnitionLocation,
          CA_BUNDLE: !Ref CertificateAuthorities,
        }
    Tags:
      - Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
        Value: "shared"

Outputs:
PrivateIP:
  Description: The compute node private IP address.
  Value: !GetAtt Worker0.PrivateIp

```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

## 4.12.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

### Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
INFO API v1.22.1 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

**NOTE**

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

**Additional resources**

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.
- You can view details about the running instances that are created by using the [AWS EC2 console](#).

**4.12.19. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

**Installing the OpenShift CLI on Windows**

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

## Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

## Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

## Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 4.12.20. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

## Prerequisites

- You deployed an OpenShift Container Platform cluster.

- You installed the **oc** CLI.

### Procedure

- Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

- Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

### Example output

```
system:admin
```

## 4.12.21. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

### Prerequisites

- You added machines to your cluster.

### Procedure

- Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

### Example output

```
NAME      STATUS   ROLES    AGE   VERSION
master-0  Ready   master   63m   v1.22.1
master-1  Ready   master   63m   v1.22.1
master-2  Ready   master   64m   v1.22.1
```

The output lists all of the machines that you created.

### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-8b2br 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

#### NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

#### NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}\n{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

**NOTE**

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

**1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}\n{{end}}{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

**Example output**

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.22.1
master-1  Ready   master 73m  v1.22.1
master-2  Ready   master 74m  v1.22.1
worker-0  Ready   worker 11m  v1.22.1
worker-1  Ready   worker 11m  v1.22.1
```

**NOTE**

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

## Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 4.12.22. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

#### Prerequisites

- Your control plane has initialized.

#### Procedure

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

#### Example output

NAME	VERSION	AVAILABLE	PROGRESSING	DEGRADED	SINCE
authentication	4.9.0	True	False	False	19m
baremetal	4.9.0	True	False	False	37m
cloud-credential	4.9.0	True	False	False	40m
cluster-autoscaler	4.9.0	True	False	False	37m
config-operator	4.9.0	True	False	False	38m
console	4.9.0	True	False	False	26m
csi-snapshot-controller	4.9.0	True	False	False	37m
dns	4.9.0	True	False	False	37m
etcd	4.9.0	True	False	False	36m
image-registry	4.9.0	True	False	False	31m
ingress	4.9.0	True	False	False	30m
insights	4.9.0	True	False	False	31m
kube-apiserver	4.9.0	True	False	False	26m
kube-controller-manager	4.9.0	True	False	False	36m
kube-scheduler	4.9.0	True	False	False	36m
kube-storage-version-migrator	4.9.0	True	False	False	37m
machine-api	4.9.0	True	False	False	29m
machine-approver	4.9.0	True	False	False	37m
machine-config	4.9.0	True	False	False	36m
marketplace	4.9.0	True	False	False	37m
monitoring	4.9.0	True	False	False	29m
network	4.9.0	True	False	False	38m

openshift-apiserver	4.9.0	True	False	False	32m
openshift-controller-manager	4.9.0	True	False	False	30m
openshift-samples	4.9.0	True	False	False	32m
operator-lifecycle-manager	4.9.0	True	False	False	37m
operator-lifecycle-manager-catalog	4.9.0	True	False	False	37m
operator-lifecycle-manager-packageserver	4.9.0	True	False	False	32m
service-ca	4.9.0	True	False	False	38m
storage	4.9.0	True	False	False	37m

2. Configure the Operators that are not available.

#### 4.12.22.1. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

You can configure registry storage for user-provisioned infrastructure in AWS to deploy OpenShift Container Platform to hidden regions. See [Configuring the registry for AWS user-provisioned infrastructure](#) for more information.

##### 4.12.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

#### Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY\_STORAGE\_S3\_ACCESSKEY**
  - **REGISTRY\_STORAGE\_S3\_SECRETKEY**

#### Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

#### Example configuration

```
storage:
  s3:
    bucket: <bucket-name>
    region: <region-name>
```

**WARNING**

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

**4.12.22.1.2. Configuring storage for the image registry in non-production clusters**

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

**Procedure**

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}'
```

**WARNING**

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

**4.12.23. Deleting the bootstrap resources**

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

**Prerequisites**

- You completed the initial Operator configuration for your cluster.

**Procedure**

- Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):
  - Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

**1** `<name>` is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

#### 4.12.24. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

##### Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

##### Procedure

1. Determine the routes to create.
  - To create a wildcard record, use **\*.apps.<cluster\_name>.<domain\_name>**, where **<cluster\_name>** is your cluster name, and **<domain\_name>** is the Route 53 base domain for your OpenShift Container Platform cluster.
  - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host} {"\n"}{end}{end}' routes
```

##### Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

##### Example output

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)
------	------	------------	-------------	---------

```
AGE
```

```
router-default LoadBalancer 172.30.62.215 ab3...28.us-east-2.elb.amazonaws.com
80:31499/TCP,443:30693/TCP 5m
```

3. Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName ==
"<external_ip>").CanonicalHostedZoneNameID' 1
```

- 1** For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

### Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
  --dns-name "<domain_name>" \ 1
  --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
`<domain_name>.`].Id' 2
  --output text
```

- 1** **2** For **<domain\_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

### Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

5. Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
>   {
>     "Action": "CREATE",
>     "ResourceRecordSet": {
>       "Name": "\\052.apps.<cluster_domain>", 2
>       "Type": "A",
>       "AliasTarget":{
>         "HostedZoneId": "<hosted_zone_id>", 3
>         "DNSName": "<external_ip>.", 4
>         "EvaluateTargetHealth": false
>       }
>     }
>   }
> }
```

```
> }
> }
> ]
> }'
```

- 1 For **<private\_hosted\_zone\_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>",
>     "Type": "A",
>     "AliasTarget": {
>       "HostedZoneId": "<hosted_zone_id>",
>       "DNSName": "<external_ip>.",
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'
```

- 1 For **<public\_hosted\_zone\_id>**, specify the public hosted zone for your domain.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

#### 4.12.25. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

## Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

## Procedure

- From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

## Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-
Wt6NL"
INFO Time elapsed: 1s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 4.12.26. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

## Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

## Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

## Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https      reencrypt/Redirect    None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

## Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 4.12.27. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.12.28. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

### 4.12.29. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.13. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.9, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

### IMPORTANT

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 4.13.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [created a mirror registry on your mirror host](#) and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

**IMPORTANT**

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You [configured an AWS account](#) to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-lived credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 4.13.2. About installations in restricted networks

In OpenShift Container Platform 4.9, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

## IMPORTANT

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

### 4.13.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 4.13.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.13.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 4.13.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 4.44. Minimum required hosts**

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

### IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 7.9, or RHEL 8.4.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#) .

#### 4.13.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.45. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so

you might need to over-allocate storage volume to obtain sufficient performance.

- As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### 4.13.4.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

#### 4.13.4.4. Supported AWS machine types

The following Amazon Web Services (AWS) instance types are supported with OpenShift Container Platform.

Example 4.42. Instance types for machines

Instance type	Bootstrap	Control plane	Compute
<b>i3.large</b>	x		
<b>m4.large</b>			x
<b>m4.xlarge</b>		x	x
<b>m4.2xlarge</b>		x	x
<b>m4.4xlarge</b>		x	x
<b>m4.10xlarge</b>		x	x
<b>m4.16xlarge</b>		x	x
<b>m5.large</b>			x
<b>m5.xlarge</b>		x	x
<b>m5.2xlarge</b>		x	x
<b>m5.4xlarge</b>		x	x
<b>m5.8xlarge</b>		x	x

Instance type	Bootstrap	Control plane	Compute
<b>m5.12xlarge</b>		x	x
<b>m5.16xlarge</b>		x	x
<b>m5a.large</b>			x
<b>m5a.xlarge</b>		x	x
<b>m5a.2xlarge</b>		x	x
<b>m5a.4xlarge</b>		x	x
<b>m5a.8xlarge</b>		x	x
<b>m5a.12xlarge</b>		x	x
<b>m5a.16xlarge</b>		x	x
<b>m6i.xlarge</b>		x	x
<b>m6i.2xlarge</b>		x	x
<b>m6i.4xlarge</b>		x	x
<b>m6i.8xlarge</b>		x	x
<b>m6i.16xlarge</b>		x	x
<b>c4.2xlarge</b>		x	x
<b>c4.4xlarge</b>		x	x
<b>c4.8xlarge</b>		x	x
<b>c5.xlarge</b>			x

#### 4.13.5. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components

- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

#### 4.13.5.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment or use a proxy, you cannot reach the public IP addresses for EC2 and ELB endpoints. To reach these endpoints, you must create a VPC endpoint and attach it to the subnet that the clusters are using. Create the following endpoints:

- **ec2.<region>.amazonaws.com**
- **elasticloadbalancing.<region>.amazonaws.com**
- **s3.<region>.amazonaws.com**

#### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.

Component	AWS type	Description												
Public subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.												
Internet gateway	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::InternetGateway</b></li> <li>● <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::Route</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>● <b>AWS::EC2::NatGateway</b></li> <li>● <b>AWS::EC2::EIP</b></li> </ul>	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.												
Network access control	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::NetworkACL</b></li> <li>● <b>AWS::EC2::NetworkACLEntry</b></li> </ul>	<p>You must allow the VPC to access the following ports:</p> <table border="1"> <thead> <tr> <th>Port</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td><b>80</b></td> <td>Inbound HTTP traffic</td> </tr> <tr> <td><b>443</b></td> <td>Inbound HTTPS traffic</td> </tr> <tr> <td><b>22</b></td> <td>Inbound SSH traffic</td> </tr> <tr> <td><b>1024 - 65535</b></td> <td>Inbound ephemeral traffic</td> </tr> <tr> <td><b>0 - 65535</b></td> <td>Outbound ephemeral traffic</td> </tr> </tbody> </table>	Port	Reason	<b>80</b>	Inbound HTTP traffic	<b>443</b>	Inbound HTTPS traffic	<b>22</b>	Inbound SSH traffic	<b>1024 - 65535</b>	Inbound ephemeral traffic	<b>0 - 65535</b>	Outbound ephemeral traffic
Port	Reason													
<b>80</b>	Inbound HTTP traffic													
<b>443</b>	Inbound HTTPS traffic													
<b>22</b>	Inbound SSH traffic													
<b>1024 - 65535</b>	Inbound ephemeral traffic													
<b>0 - 65535</b>	Outbound ephemeral traffic													
Private subnets	<ul style="list-style-type: none"> <li>● <b>AWS::EC2::Subnet</b></li> <li>● <b>AWS::EC2::RouteTable</b></li> <li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li> </ul>	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.												

## Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api.<cluster\_name>.<domain>** must point to the external load balancer, and an entry for **api-int.<cluster\_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	<b>AWS::Route53::HostedZone</b>	The hosted zone for your internal DNS.
etcd record sets	<b>AWS::Route53::RecordSet</b>	The registration records for etcd for your control plane machines.
Public load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your public subnets.
External API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the external API server.
External listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the external load balancer.
External target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the external load balancer.
Private load balancer	<b>AWS::ElasticLoadBalancingV2::LoadBalancer</b>	The load balancer for your private subnets.
Internal API server record	<b>AWS::Route53::RecordSetGroup</b>	Alias records for the internal API server.

Component	AWS type	Description
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 22623 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.
Internal listener	<b>AWS::ElasticLoadBalancingV2::Listener</b>	A listener on port 6443 for the internal load balancer.
Internal target group	<b>AWS::ElasticLoadBalancingV2::TargetGroup</b>	The target group for the internal load balancer.

## Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
<b>MasterSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>6443</b>
		<b>tcp</b>	<b>22623</b>
<b>WorkerSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>icmp</b>	<b>0</b>
		<b>tcp</b>	<b>22</b>
<b>BootstrapSecurityGroup</b>	<b>AWS::EC2::SecurityGroup</b>	<b>tcp</b>	<b>22</b>
		<b>tcp</b>	<b>19531</b>

## Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>MasterIngress Etc</b>	etcd	<b>tcp</b>	<b>2379- 2380</b>
<b>MasterIngress Vxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>MasterIngress WorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>MasterIngress Internal</b>	Internal cluster communication and Kubernetes proxy metrics	<b>tcp</b>	<b>9000 - 9999</b>
<b>MasterIngress WorkerIntern al</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>MasterIngress Kube</b>	Kubernetes kubelet, scheduler and controller manager	<b>tcp</b>	<b>10250 - 10259</b>
<b>MasterIngress WorkerKube</b>	Kubernetes kubelet, scheduler and controller manager	<b>tcp</b>	<b>10250 - 10259</b>
<b>MasterIngress IngressServic es</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>MasterIngress WorkerIngress Services</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>MasterIngress Geneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>MasterIngress WorkerGenev e</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>MasterIngress Ipseclke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress WorkerIpseclk e</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>MasterIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>

Ingress group	Description	IP protocol	Port range
<b>MasterIngress WorkerIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>MasterIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress WorkerIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>MasterIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress WorkerInternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>MasterIngress IngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>MasterIngress WorkerIngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress Vxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress WorkerVxlan</b>	Vxlan packets	<b>udp</b>	<b>4789</b>
<b>WorkerIngress Internal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>
<b>WorkerIngress WorkerInternal</b>	Internal cluster communication	<b>tcp</b>	<b>9000 - 9999</b>

Ingress group	Description	IP protocol	Port range
<b>WorkerIngress Kube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress WorkerKube</b>	Kubernetes kubelet, scheduler, and controller manager	<b>tcp</b>	<b>10250</b>
<b>WorkerIngress IngressServices</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress WorkerIngress Services</b>	Kubernetes Ingress services	<b>tcp</b>	<b>30000 - 32767</b>
<b>WorkerIngress Geneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress MasterGeneve</b>	Geneve packets	<b>udp</b>	<b>6081</b>
<b>WorkerIngress IpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress MasterIpsecIke</b>	IPsec IKE packets	<b>udp</b>	<b>500</b>
<b>WorkerIngress IpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>WorkerIngress MasterIpsecNat</b>	IPsec NAT-T packets	<b>udp</b>	<b>4500</b>
<b>WorkerIngress IpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress MasterIpsecEsp</b>	IPsec ESP packets	<b>50</b>	<b>All</b>
<b>WorkerIngress InternalUDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>
<b>WorkerIngress MasterInternal UDP</b>	Internal cluster communication	<b>udp</b>	<b>9000 - 9999</b>

Ingress group	Description	IP protocol	Port range
<b>WorkerIngressIngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>
<b>WorkerIngressMasterIngressServicesUDP</b>	Kubernetes Ingress services	<b>udp</b>	<b>30000 - 32767</b>

## Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	<b>Allow</b>	<b>ec2:*</b>	*
	<b>Allow</b>	<b>elasticloadbalancing:*</b>	*
	<b>Allow</b>	<b>iam:PassRole</b>	*
	<b>Allow</b>	<b>s3:GetObject</b>	*
Worker	<b>Allow</b>	<b>ec2:Describe*</b>	*
Bootstrap	<b>Allow</b>	<b>ec2:Describe*</b>	*
	<b>Allow</b>	<b>ec2:AttachVolume</b>	*
	<b>Allow</b>	<b>ec2:DetachVolume</b>	*

### 4.13.5.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a machine set.

### 4.13.5.3. Required AWS permissions for the IAM user

**NOTE**

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

**Example 4.43. Required EC2 permissions for installation**

- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:AttachNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**

- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.44. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**

- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

**NOTE**

If you use an existing VPC, your account does not require these permissions for creating network resources.

**Example 4.45. Required Elastic Load Balancing permissions (ELB) for installation**

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateLoadBalancerListeners**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

**Example 4.46. Required Elastic Load Balancing permissions (ELBv2) for installation**

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:CreateListener**
- **elasticloadbalancing:CreateLoadBalancer**
- **elasticloadbalancing:CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterTargets**

**Example 4.47. Required IAM permissions for installation**

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam>DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**

- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

**NOTE**

If you have not created an elastic load balancer (ELB) in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

**Example 4.48. Required Route 53 permissions for installation**

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

**Example 4.49. Required S3 permissions for installation**

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**

- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketReplication**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.50. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.51. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeleteVolume**

- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:ListAttachedRolePolicies**
- **iam:ListInstanceProfiles**
- **iam:ListRolePolicies**
- **iam:ListUserPolicies**
- **s3:DeleteObject**
- **s3:ListBucketVersions**
- **tag:GetResources**

Example 4.52. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**
- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

**Example 4.53. Required permissions to delete a cluster with shared instance roles**

- **iam:UntagRole**

**Example 4.54. Additional IAM and S3 permissions that are required to create manifests**

- **iam>DeleteAccessKey**
- **iam>DeleteUser**
- **iam>DeleteUserPolicy**
- **iam:GetUserPolicy**
- **iam>ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:PutBucketPublicAccessBlock**
- **s3:GetBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**
- **s3:HeadBucket**
- **s3:ListBucketMultipartUploads**
- **s3:AbortMultipartUpload**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 4.55. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

### 4.13.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

### 4.13.7. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

#### 4.13.7.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.

- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

### Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
      partitions:
        - label: var
          start_mib: <partition_start_offset> 2
          size_mib: <partition_size> 3
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] 4
          with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

#### NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

#### 4.13.7.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

##### Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

##### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

##### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.
    - a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<local_registry>": {"auth": "<credentials>","email": "you@example.com"}}}'
```

For **<local\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value. The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  /-----END CERTIFICATE-----
```

- c. Add the image content resources:

```
imageContentSources:
```

```

- mirrors:
  - <local_registry>/<local_repository_name>/release
    source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - <local_registry>/<local_repository_name>/release
    source: quay.io/openshift-release-dev/ocp-v4.0-art-dev

```

Use the **imageContentSources** section from the output of the command to mirror the repository or the values that you used when you mirrored the content from the media that you brought into your restricted network.

- d. Optional: Set the publishing strategy to **Internal**:

```
publish: Internal
```

By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Optional: Back up the **install-config.yaml** file.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

#### 4.13.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

- You have added the **ec2.<region>.amazonaws.com**, **elasticloadbalancing.<region>.amazonaws.com**, and **s3.<region>.amazonaws.com** endpoints to your VPC endpoint. These endpoints are required to complete requests from the nodes to the AWS EC2 API. Because the proxy works on the container level, not the node level, you must route these requests to the AWS EC2 API through the AWS private network. Adding the public IP address of the EC2 API to your allowlist in your proxy server is not sufficient.

## Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

- A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- A proxy URL to use for creating HTTPS connections outside the cluster.
- A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

- Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 4.13.7.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**Prerequisites**

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.
- You created the **install-config.yaml** installation configuration file.

**Procedure**

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

- Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

- Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:
  - Open the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** file.
  - Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
  - Save and exit the file.
- Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the **<installation\_directory>/manifests/cluster-dns-02-config.yml** DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

- To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- For **<installation\_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation\_directory>/auth** directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
```

### 4.13.8. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

#### Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

#### Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

#### Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

### 4.13.9. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "VpcCidr", 1
    "ParameterValue": "10.0.0.0/16" 2
  },
  {
    "ParameterKey": "AvailabilityZoneCount", 3
    "ParameterValue": "1" 4
  },
  {
    "ParameterKey": "SubnetBits", 5
    "ParameterValue": "12" 6
  }
]
```

- 1** The CIDR block for the VPC.
- 2** Specify a CIDR block in the format **x.x.x.x/16-24**.
- 3** The number of availability zones to deploy the VPC in.
- 4** Specify an integer between **1** and **3**.
- 5** The size of each subnet in each availability zone.
- 6** Specify an integer between **5** and **13**, where **5** is /27 and **13** is /19.

2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>VpcId</b>	The ID of your VPC.
<b>PublicSubnetIds</b>	The IDs of the new public subnets.
<b>PrivateSubnetIds</b>	The IDs of the new private subnets.

#### 4.13.9.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

##### Example 4.56. CloudFormation template for the VPC

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
  VpcCidr:
    AllowedPattern: ^(((0-9){1,3}(0-9){1,3}|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.)\.{3}((0-9){1,3}|1[0-9]{2}|2[0-4][0-9]|25[0-5])((1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0.0/16
    Description: CIDR block for VPC.
    Type: String
  AvailabilityZoneCount:
    ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
    MinValue: 1
    MaxValue: 3
```

```

Default: 1
Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
Type: Number
SubnetBits:
ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
MinValue: 5
MaxValue: 13
Default: 12
Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 =
/19)"
Type: Number

Metadata:
AWS::CloudFormation::Interface:

      - [!Ref PrivateSubnet, !If [DoAz2, !Ref PrivateSubnet2, !Ref "AWS::NoValue"], !If [DoAz3, !Ref
PrivateSubnet3, !Ref "AWS::NoValue"]]
    ]

```

### 4.13.10. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

#### Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1** For the **<route53\_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

#### Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "ClusterName", 1
    "ParameterValue": "mycluster" 2
  }
]
```

```

},
{
  "ParameterKey": "InfrastructureName", ❸
  "ParameterValue": "mycluster-<random_string>" ❹
},
{
  "ParameterKey": "HostedZoneId", ❺
  "ParameterValue": "<random_string>" ❻
},
{
  "ParameterKey": "HostedZoneName", ❼
  "ParameterValue": "example.com" ❽
},
{
  "ParameterKey": "PublicSubnets", ❾
  "ParameterValue": "subnet-<random_string>" ❿
},
{
  "ParameterKey": "PrivateSubnets", ⓫
  "ParameterValue": "subnet-<random_string>" ⓬
},
{
  "ParameterKey": "VpcId", ⓭
  "ParameterValue": "vpc-<random_string>" ⓮
}
]

```

- ❶ A short, representative cluster name to use for hostnames, etc.
- ❷ Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
- ❸ The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- ❹ Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- ❺ The Route 53 public zone ID to register the targets with.
- ❻ Specify the Route 53 public zone ID, which as a format similar to **Z21IXYZABCZ2A4**. You can obtain this value from the AWS console.
- ❼ The Route 53 zone to register the targets with.
- ❽ Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- ❾ The public subnets that you created for your VPC.
- ❿ Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- ⓫ The private subnets that you created for your VPC.

- 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 13 The VPC that you created for the cluster.
  - 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

### IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>PrivateHostedZoneId</b>	Hosted zone ID for the private DNS.
<b>ExternalApiLoadBalancerName</b>	Full name of the external API load balancer.
<b>InternalApiLoadBalancerName</b>	Full name of the internal API load balancer.
<b>ApiServerDnsName</b>	Full hostname of the API server.
<b>RegisterNlbTargetLambda</b>	Lambda ARN useful to help register/deregister IP targets for these load balancers.
<b>ExternalApiTargetGroupArn</b>	ARN of external API target group.
<b>InternalApiTargetGroupArn</b>	ARN of internal API target group.
<b>InternalServiceTargetGroupArn</b>	ARN of internal service target group.

#### 4.13.10.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

##### Example 4.57. CloudFormation template for the network and load balancers

AWSTemplateFormatVersion: [2010-09-09](#)  
 Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:

ClusterName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9-]{0,26}$`

MaxLength: [27](#)

MinLength: [1](#)

ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, representative cluster name to use for host names and other identifying names.

Type: String

InfrastructureName:

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\\_]{0,26})\$

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

HostedZoneId:

Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.

Type: String

HostedZoneName:

Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.

Type: String

Default: "example.com"

PublicSubnets:

Description: The internet-facing subnets.

Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:

Description: The internal subnets.

Type: List<AWS::EC2::Subnet::Id>

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: AWS::EC2::VPC::Id

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- ClusterName

- InfrastructureName

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- PublicSubnets

- PrivateSubnets

- Label:

default: "DNS"

Parameters:

- HostedZoneName

- HostedZoneId

ParameterLabels:

ClusterName:

default: "Cluster Name"

InfrastructureName:

```

    default: "Infrastructure Name"
  VpcId:
    default: "VPC ID"
  PublicSubnets:
    default: "Public Subnets"
  PrivateSubnets:
    default: "Private Subnets"
  HostedZoneName:
    default: "Public Hosted Zone Name"
  HostedZoneId:
    default: "Public Hosted Zone ID"

```

## Resources:

## ExtApiElb:

```

Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:
  Name: !Join ["-", [!Ref InfrastructureName, "ext"]]
  IpAddressType: ipv4
  Subnets: !Ref PublicSubnets
  Type: network

```

## IntApiElb:

```

Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:
  Name: !Join ["-", [!Ref InfrastructureName, "int"]]
  Scheme: internal
  IpAddressType: ipv4
  Subnets: !Ref PrivateSubnets
  Type: network

```

## IntDns:

```

Type: "AWS::Route53::HostedZone"
Properties:
  HostedZoneConfig:
    Comment: "Managed by CloudFormation"
  Name: !Join [".", [!Ref ClusterName, !Ref HostedZoneName]]
  HostedZoneTags:
    - Key: Name
      Value: !Join ["-", [!Ref InfrastructureName, "int"]]
    - Key: !Join [ "", ["kubernetes.io/cluster/", !Ref InfrastructureName] ]
      Value: "owned"
  VPCs:
    - VPCId: !Ref VpcId
      VPCRegion: !Ref "AWS::Region"

```

## ExternalApiServerRecord:

```

Type: AWS::Route53::RecordSetGroup
Properties:
  Comment: Alias record for the API server
  HostedZoneId: !Ref HostedZoneId
  RecordSets:
    - Name:
      !Join [
        ".",
        ["api", !Ref ClusterName, !Join [ "", [!Ref HostedZoneName, "."] ]],
      ]

```

Type: A  
 AliasTarget:  
 HostedZoneId: !GetAtt ExtApiElb.CanonicalHostedZoneID  
 DNSName: !GetAtt ExtApiElb.DNSName

#### InternalApiServerRecord:

Type: AWS::Route53::RecordSetGroup  
 Properties:  
 Comment: Alias record for the API server  
 HostedZoneId: !Ref IntDns  
 RecordSets:  
 - Name:  
   !Join [  
     ".",  
     ["api", !Ref ClusterName, !Join ["", [!Ref HostedZoneName, "."]]],  
   ]  
 Type: A  
 AliasTarget:  
 HostedZoneId: !GetAtt IntApiElb.CanonicalHostedZoneID  
 DNSName: !GetAtt IntApiElb.DNSName  
 - Name:  
   !Join [  
     ".",  
     ["api-int", !Ref ClusterName, !Join ["", [!Ref HostedZoneName, "."]]],  
   ]  
 Type: A  
 AliasTarget:  
 HostedZoneId: !GetAtt IntApiElb.CanonicalHostedZoneID  
 DNSName: !GetAtt IntApiElb.DNSName

#### ExternalApiListener:

Type: AWS::ElasticLoadBalancingV2::Listener  
 Properties:  
 DefaultActions:  
 - Type: forward  
   TargetGroupArn:  
     Ref: ExternalApiTargetGroup  
 LoadBalancerArn:  
   Ref: ExtApiElb  
 Port: 6443  
 Protocol: TCP

#### ExternalApiTargetGroup:

Type: AWS::ElasticLoadBalancingV2::TargetGroup  
 Properties:  
 HealthCheckIntervalSeconds: 10  
 HealthCheckPath: "/readyz"  
 HealthCheckPort: 6443  
 HealthCheckProtocol: HTTPS  
 HealthyThresholdCount: 2

## Code:

```

ZipFile: |
import json
import boto3
import cfnresponse
def handler(event, context):
    ec2_client = boto3.client('ec2')
    if event['RequestType'] == 'Delete':
        for subnet_id in event['ResourceProperties']['Subnets']:
            ec2_client.delete_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
event['ResourceProperties']['InfrastructureName']}]);
    elif event['RequestType'] == 'Create':
        for subnet_id in event['ResourceProperties']['Subnets']:
            ec2_client.create_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
event['ResourceProperties']['InfrastructureName'], 'Value': 'shared'}]);
        responseData = {}
        cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData,
event['ResourceProperties']['InfrastructureName']+event['ResourceProperties']['Subnets'][:0])
Runtime: "python3.7"
Timeout: 120

```

## RegisterPublicSubnetTags:

Type: Custom::SubnetRegister

Properties:

ServiceToken: !GetAtt RegisterSubnetTags.Arn

InfrastructureName: !Ref InfrastructureName

Subnets: !Ref PublicSubnets

## RegisterPrivateSubnetTags:

Type: Custom::SubnetRegister

Properties:

ServiceToken: !GetAtt RegisterSubnetTags.Arn

InfrastructureName: !Ref InfrastructureName

Subnets: !Ref PrivateSubnets

## Outputs:

PrivateHostedZoneId:

Description: Hosted zone ID for the private DNS, which is required for private records.

Value: !Ref IntDns

ExternalApiLoadBalancerName:

Description: Full name of the external API load balancer.

Value: !GetAtt ExtApiElb.LoadBalancerFullName

InternalApiLoadBalancerName:

Description: Full name of the internal API load balancer.

Value: !GetAtt IntApiElb.LoadBalancerFullName

ApiServerDnsName:

Description: Full hostname of the API server, which is required for the Ignition config files.

Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]

RegisterNlbIpTargetsLambda:

Description: Lambda ARN useful to help register or deregister IP targets for these load

balancers.

Value: !GetAtt RegisterNlbTargets.Arn

ExternalApiTargetGroupArn:

Description: ARN of the external API target group.

Value: !Ref ExternalApiTargetGroup

InternalApiTargetGroupArn:

Description: ARN of the internal API target group.

Value: !Ref InternalApiTargetGroup

InternalServiceTargetGroupArn:

Description: ARN of the internal service target group.

Value: !Ref InternalServiceTargetGroup

## IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

Type: CNAME

TTL: 10

ResourceRecords:

- !GetAtt IntApiElb.DNSName

## Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

## 4.13.11. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", ❶
    "ParameterValue": "mycluster-<random_string>" ❷
  },
  {
    "ParameterKey": "VpcCidr", ❸
    "ParameterValue": "10.0.0.0/16" ❹
  },
  {
    "ParameterKey": "PrivateSubnets", ❺
    "ParameterValue": "subnet-<random_string>" ❻
  },
  {
    "ParameterKey": "VpcId", ❼
    "ParameterValue": "vpc-<random_string>" ❽
  }
]
```

- ❶ The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - ❷ Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - ❸ The CIDR block for the VPC.
  - ❹ Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
  - ❺ The private subnets that you created for your VPC.
  - ❻ Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - ❼ The VPC that you created for the cluster.
  - ❽ Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
2. Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> ❶
  --template-body file://<template>.yaml ❷
  --parameters file://<parameters>.json ❸
  --capabilities CAPABILITY_NAMED_IAM ❹
```

- ❶ **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- ❷ **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- ❸ **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- ❹ You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>MasterSecurityGroupID</b>	Master Security Group ID
<b>WorkerSecurityGroupID</b>	Worker Security Group ID
<b>MasterInstanceProfile</b>	Master IAM Instance Profile
<b>WorkerInstanceProfile</b>	Worker IAM Instance Profile

#### 4.13.11.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

**Example 4.58. CloudFormation template for security objects**

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
used by the cluster.
    Type: String
  VpcCidr:
    AllowedPattern: ^((([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-
4][0-9]|25[0-5])|(1[6-9]|2[0-4]))$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
    Default: 10.0.0/16
    Description: CIDR block for VPC.
    Type: String
  VpcId:
    Description: The VPC-scoped resources will belong to this VPC.
    Type: AWS::EC2::VPC::Id
  PrivateSubnets:
    Description: The internal subnets.

#### 4.13.12. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

## Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
  - Print the current **x86\_64** AMI for an AWS region, such as **us-west-1**:

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

### Example output

```
ami-0d3e625f84626bbda
```

The output of this command is the AWS AMI ID for the **us-west-1** region. The AMI must belong to the same region as the cluster.

### 4.13.13. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions that you can manually specify for your OpenShift Container Platform nodes.

#### NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 4.46. RHCOS AMIs

AWS zone	AWS AMI
<b>af-south-1</b>	<b>ami-0f3804f5a2f913dcc</b>
<b>ap-east-1</b>	<b>ami-0de1febb30a83da66</b>
<b>ap-northeast-1</b>	<b>ami-0183df96a3e002687</b>

us-west-2	ami-084fb1316cd1ed4cc

#### 4.13.14. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

#### NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

## Procedure

1. Provide a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. One way to do this is to create an S3 bucket in your cluster's region and upload the Ignition config file to it.

### IMPORTANT

The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.

### IMPORTANT

If you are deploying to a region that has endpoints that differ from the AWS SDK, or you are providing your own custom endpoints, you must use a presigned URL for your S3 bucket instead of the **s3://** schema.

### NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

- a. Create the bucket:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1** **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

- b. Upload the **bootstrap.ign** Ignition config file to the bucket:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign 1
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

c. Verify that the file uploaded:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

### Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

2. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcOsAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AllowedBootstrapSshCidr", 5
    "ParameterValue": "0.0.0.0/0" 6
  },
  {
    "ParameterKey": "PublicSubnet", 7
    "ParameterValue": "subnet-<random_string>" 8
  },
  {
    "ParameterKey": "MasterSecurityGroupID", 9
    "ParameterValue": "sg-<random_string>" 10
  },
  {
    "ParameterKey": "VpcID", 11
    "ParameterValue": "vpc-<random_string>" 12
  },
  {
    "ParameterKey": "BootstrapIgnitionLocation", 13
    "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
  },
  {
    "ParameterKey": "AutoRegisterELB", 15
    "ParameterValue": "yes" 16
  },
  {
    "ParameterKey": "RegisterNlbTargetsLambdaArn", 17
    "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 18
  },
]
```

```

{
  "ParameterKey": "ExternalApiTargetGroupArn", 19
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
},
{
  "ParameterKey": "InternalApiTargetGroupArn", 21
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
},
{
  "ParameterKey": "InternalServiceTargetGroupArn", 23
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
}
]

```

- 1** The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2** Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3** Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node.
- 4** Specify a valid **AWS::EC2::Image::Id** value.
- 5** CIDR block to allow SSH access to the bootstrap node.
- 6** Specify a CIDR block in the format **x.x.x.x/16-24**.
- 7** The public subnet that is associated with your VPC to launch the bootstrap node into.
- 8** Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 9** The master security group ID (for registering temporary rules)
- 10** Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 11** The VPC created resources will belong to.
- 12** Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- 13** Location to fetch bootstrap Ignition config file from.
- 14** Specify the S3 bucket and file name in the form **s3://<bucket\_name>/bootstrap.ign**.
- 15** Whether or not to register a network load balancer (NLB).
- 16** Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 17** The ARN for NLB IP target registration lambda group.

- 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an
  - 19 The ARN for external API load balancer target group.
  - 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 21 The ARN for internal API load balancer target group.
  - 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 23 The ARN for internal service load balancer target group.
  - 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
3. Copy the template from the **CloudFormation template for the bootstrap machines** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
  4. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
  --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

<b>Bootstrap InstanceId</b>	The bootstrap Instance ID.
<b>Bootstrap PublicIp</b>	The bootstrap node public IP address.
<b>Bootstrap PrivateIp</b>	The bootstrap node private IP address.

#### 4.13.14.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

##### Example 4.59. CloudFormation template for the bootstrap machine

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
  InfrastructureName:
    AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$
    MaxLength: 27
    MinLength: 1
    ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
    Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
    Type: String
  RhcosAmi:
    Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
    Type: AWS::EC2::Image::Id
  AllowedBootstrapSshCidr:
    AllowedPattern: ^((([0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3})\.){3}([0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3})\.[0-9]{1,3}|([0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3})\.[0-9]{1,3}|([0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3})\.[0-9]{1,3}|([0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3}|[0-9]{1,3})\.[0-9]{1,3})$
    ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
    Default: 0.0.0.0/0
    Description: CIDR block to allow SSH access to the bootstrap node.
    Type: String
  PublicSubnet:
    Description: The public subnet to launch the bootstrap node into.
```

```

Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
  Description: The master security group ID for registering temporary rules.
  Type: AWS::EC2::SecurityGroup::Id
VpcId:
  Description: The VPC-scoped resources will belong to this VPC.
  Type: AWS::EC2::VPC::Id
BootstrapIgnitionLocation:
  Default: s3://my-s3-bucket/bootstrap.ign
  Description: Ignition config file location.
  Type: String
AutoRegisterELB:
  Default: "yes"
  AllowedValues:
  - "yes"
  - "no"
  Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
  Type: String
RegisterNlbTargetsLambdaArn:
  Description: ARN for NLB IP target registration lambda.
  Type: String
ExternalApiTargetGroupArn:
  Description: ARN for external API load balancer target group.
  Type: String
InternalApiTargetGroupArn:
  Description: ARN for internal API load balancer target group.
  Type: String
InternalServiceTargetGroupArn:
  Description: ARN for internal service load balancer target group.
  Type: String

Metadata:
AWS::CloudFormation::Interface:
  ParameterGroups:
  - Label:

```

### Additional resources

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

## 4.13.15. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

### IMPORTANT

The CloudFormation template creates a stack that represents three control plane nodes.

### NOTE

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcoshAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "AutoRegisterDNS", 5
    "ParameterValue": "yes" 6
  },
  {
    "ParameterKey": "PrivateHostedZoneId", 7
    "ParameterValue": "<random_string>" 8
  },
  {
    "ParameterKey": "PrivateHostedZoneName", 9
    "ParameterValue": "mycluster.example.com" 10
  },
  {
    "ParameterKey": "Master0Subnet", 11
    "ParameterValue": "subnet-<random_string>" 12
  },
  {
    "ParameterKey": "Master1Subnet", 13
    "ParameterValue": "subnet-<random_string>" 14
  },
  {
    "ParameterKey": "Master2Subnet", 15
    "ParameterValue": "subnet-<random_string>" 16
  },
  {
    "ParameterKey": "MasterSecurityGroupID", 17
    "ParameterValue": "sg-<random_string>" 18
  },
  {
    "ParameterKey": "IgnitionLocation", 19
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master" 20
  }
]
```

```

},
{
  "ParameterKey": "CertificateAuthorities", 21
  "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
},
{
  "ParameterKey": "MasterInstanceProfileName", 23
  "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
},
{
  "ParameterKey": "MasterInstanceType", 25
  "ParameterValue": "m5.xlarge" 26
},
{
  "ParameterKey": "AutoRegisterELB", 27
  "ParameterValue": "yes" 28
},
{
  "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
  "ParameterValue": "arn:aws:lambda:<region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
},
{
  "ParameterKey": "ExternalApiTargetGroupArn", 31
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
},
{
  "ParameterKey": "InternalApiTargetGroupArn", 33
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
},
{
  "ParameterKey": "InternalServiceTargetGroupArn", 35
  "ParameterValue": "arn:aws:elasticloadbalancing:<region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
}
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.
- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.

- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster\_name>.<domain\_name>** where **<domain\_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17 The master security group ID to associate with control plane nodes.
- 18 Specify the **MasterSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.
- 19 The location to fetch control plane Ignition config file from.
- 20 Specify the generated Ignition config file location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/master](https://api-int.<cluster_name>.<domain_name>:22623/config/master).
- 21 The base64 encoded certificate authority string to use.
- 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 23 The IAM profile to associate with control plane nodes.
- 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 25 The type of AWS instance to use for the control plane machines.
- 26 Allowed values:
  - **m4.xlarge**
  - **m4.2xlarge**
  - **m4.4xlarge**
  - **m4.10xlarge**
  - **m4.16xlarge**
  - **m5.xlarge**
  - **m5.2xlarge**
  - **m5.4xlarge**
  - **m5.8xlarge**

- **m5.12xlarge**
- **m5.16xlarge**
- **m5a.xlarge**
- **m5a.2xlarge**
- **m5a.4xlarge**
- **m5a.8xlarge**
- **m5a.12xlarge**
- **m5a.16xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**
- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.xlarge**

- **r5.2xlarge**
  - **r5.4xlarge**
  - **r5.8xlarge**
  - **r5.12xlarge**
  - **r5.16xlarge**
  - **r5.24xlarge**
  - **r5a.xlarge**
  - **r5a.2xlarge**
  - **r5a.4xlarge**
  - **r5a.8xlarge**
  - **r5a.12xlarge**
  - **r5a.16xlarge**
  - **r5a.24xlarge**
- 27** Whether or not to register a network load balancer (NLB).
- 28** Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 29** The ARN for NLB IP target registration lambda group.
- 30** Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 31** The ARN for external API load balancer target group.
- 32** Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 33** The ARN for internal API load balancer target group.
- 34** Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 35** The ARN for internal service load balancer target group.
- 36** Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

- Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
- If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
- Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- <name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- <template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- <parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

### NOTE

The CloudFormation template creates a stack that represents three control plane nodes.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

#### 4.13.15.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

#### Example 4.60. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)
```

## Parameters:

## InfrastructureName:

AllowedPattern: `^[a-zA-Z][a-zA-Z0-9\-\]{0,26}$`

MaxLength: `27`

MinLength: `1`

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of `27` characters.

Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.

Type: String

## RhcOSAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: `AWS::EC2::Image::Id`

## AutoRegisterDNS:

Default: `"yes"`

AllowedValues:

- `"yes"`

- `"no"`

Description: Do you want to invoke DNS etcd registration, which requires Hosted Zone information?

Type: String

## PrivateHostedZoneId:

Description: The Route53 private zone ID to register the etcd targets with, such as `Z21IXYZABCZ2A4`.

Type: String

## PrivateHostedZoneName:

Description: The Route53 zone to register the targets with, such as `cluster.example.com`. Omit the trailing period.

Type: String

## Master0Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: `AWS::EC2::Subnet::Id`

## Master1Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: `AWS::EC2::Subnet::Id`

## Master2Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: `AWS::EC2::Subnet::Id`

## MasterSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: `AWS::EC2::SecurityGroup::Id`

## IgnitionLocation:

Default: `https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master`

Description: Ignition config file location.

Type: String

## CertificateAuthorities:

Default: `data:text/plain;charset=utf-8;base64,ABC...xYz==`

Description: Base64 encoded certificate authority string to use.

Type: String

## MasterInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

## MasterInstanceType:

Default: `m5.xlarge`

Type: String

## AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"
- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

Metadata:

#### 4.13.16. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

#### IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

## NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

## Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
  {
    "ParameterKey": "InfrastructureName", 1
    "ParameterValue": "mycluster-<random_string>" 2
  },
  {
    "ParameterKey": "RhcocAmi", 3
    "ParameterValue": "ami-<random_string>" 4
  },
  {
    "ParameterKey": "Subnet", 5
    "ParameterValue": "subnet-<random_string>" 6
  },
  {
    "ParameterKey": "WorkerSecurityGroupld", 7
    "ParameterValue": "sg-<random_string>" 8
  },
  {
    "ParameterKey": "IgnitionLocation", 9
    "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
  },
  {
    "ParameterKey": "CertificateAuthorities", 11
    "ParameterValue": "" 12
  }
]
```

```

    },
    {
      "ParameterKey": "WorkerInstanceProfileName", 13
      "ParameterValue": "" 14
    },
    {
      "ParameterKey": "WorkerInstanceType", 15
      "ParameterValue": "m4.2xlarge" 16
    }
  ]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 A subnet, preferably private, to start the worker nodes on.
- 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 7 The worker security group ID to associate with worker nodes.
- 8 Specify the **WorkerSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.
- 9 The location to fetch the bootstrap Ignition config file from.
- 10 Specify the generated Ignition config location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/worker](https://api-int.<cluster_name>.<domain_name>:22623/config/worker).
- 11 Base64 encoded certificate authority string to use.
- 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 13 The IAM profile to associate with worker nodes.
- 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 15 The type of AWS instance to use for the control plane machines.
- 16 Allowed values:
  - **m4.large**
  - **m4.xlarge**
  - **m4.2xlarge**
  - **m4.4xlarge**

- **m4.10xlarge**
- **m4.16xlarge**
- **m5.large**
- **m5.xlarge**
- **m5.2xlarge**
- **m5.4xlarge**
- **m5.8xlarge**
- **m5.12xlarge**
- **m5.16xlarge**
- **m5a.large**
- **m5a.xlarge**
- **m5a.2xlarge**
- **m5a.4xlarge**
- **m5a.8xlarge**
- **m5a.12xlarge**
- **m5a.16xlarge**
- **c4.large**
- **c4.xlarge**
- **c4.2xlarge**
- **c4.4xlarge**
- **c4.8xlarge**
- **c5.large**
- **c5.xlarge**
- **c5.2xlarge**
- **c5.4xlarge**
- **c5.9xlarge**
- **c5.12xlarge**
- **c5.18xlarge**
- **c5.24xlarge**

- **c5a.large**
- **c5a.xlarge**
- **c5a.2xlarge**
- **c5a.4xlarge**
- **c5a.8xlarge**
- **c5a.12xlarge**
- **c5a.16xlarge**
- **c5a.24xlarge**
- **r4.large**
- **r4.xlarge**
- **r4.2xlarge**
- **r4.4xlarge**
- **r4.8xlarge**
- **r4.16xlarge**
- **r5.large**
- **r5.xlarge**
- **r5.2xlarge**
- **r5.4xlarge**
- **r5.8xlarge**
- **r5.12xlarge**
- **r5.16xlarge**
- **r5.24xlarge**
- **r5a.large**
- **r5a.xlarge**
- **r5a.2xlarge**
- **r5a.4xlarge**
- **r5a.8xlarge**
- **r5a.12xlarge**
- **r5a.16xlarge**

- **r5a.24xlarge**
  - **t3.large**
  - **t3.xlarge**
  - **t3.2xlarge**
  - **t3a.large**
  - **t3a.xlarge**
  - **t3a.2xlarge**
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.
  3. Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
  4. Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
  5. Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml \ 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

**NOTE**

The CloudFormation template creates a stack that represents one worker node.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

- Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

#### 4.13.16.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

##### Example 4.61. CloudFormation template for worker machines

AWSTemplateFormatVersion: 2010-09-09

Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:

InfrastructureName:

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\\_]{0,26})\$

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: AWS::EC2::Image::Id

Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: AWS::EC2::Subnet::Id

WorkerSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: AWS::EC2::SecurityGroup::Id

IgnitionLocation:

Default: https://api-int.\$CLUSTER\_NAME.\$DOMAIN:22623/config/worker

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: data:text/plain;charset=utf-8;base64,ABC...xYz==

Description: Base64 encoded certificate authority string to use.

Type: String

WorkerInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

WorkerInstanceType:

Default: m5.large

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- WorkerInstanceType

- RhcosAmi

- IgnitionLocation

- CertificateAuthorities

- WorkerSecurityGroupId

- WorkerInstanceProfileName

- Label:

default: "Network Configuration"

Parameters:

- Subnet

ParameterLabels:

Subnet:

default: "Subnet"

InfrastructureName:

default: "Infrastructure Name"

WorkerInstanceType:

default: "Worker Instance Type"

WorkerInstanceProfileName:

default: "Worker Instance Profile Name"

RhcosAmi:

default: "Red Hat Enterprise Linux CoreOS AMI ID"

IgnitionLocation:

default: "Worker Ignition Source"

CertificateAuthorities:

default: "Ignition CA String"

WorkerSecurityGroupId:

default: "Worker Security Group ID"

Resources:

Worker0:

Type: AWS::EC2::Instance

Properties:

ImageId: !Ref RhcosAmi

BlockDeviceMappings:

- DeviceName: /dev/xvda

Ebs:

VolumeSize: "120"

VolumeType: "gp2"

IamInstanceProfile: !Ref WorkerInstanceProfileName

InstanceType: !Ref WorkerInstanceType

```

NetworkInterfaces:
- AssociatePublicIpAddress: "false"
  DeviceIndex: "0"
  GroupSet:
- !Ref "WorkerSecurityGroup"
  SubnetId: !Ref "Subnet"
UserData:
  Fn::Base64: !Sub
- '{"ignition":{"config":{"merge":[{"source":"${SOURCE}"}]},"security":{"tls":
{"certificateAuthorities":[{"source":"${CA_BUNDLE}"}]},"version":"3.1.0"}}'
- {
  SOURCE: !Ref IgnitionLocation,
  CA_BUNDLE: !Ref CertificateAuthorities,
}
Tags:
- Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
  Value: "shared"

Outputs:
PrivateIP:
  Description: The compute node private IP address.
  Value: !GetAtt Worker0.PrivateIp

```

#### 4.13.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

##### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

##### Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```

$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2

```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### Example output

```

INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
INFO API v1.22.1 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s

```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

#### NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

### Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.

### 4.13.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```

$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1

```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.13.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

#### Prerequisites

- You added machines to your cluster.

#### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.22.1
master-1  Ready   master 63m  v1.22.1
master-2  Ready   master 64m  v1.22.1
```

The output lists all of the machines that you created.

#### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

#### Example output

```
NAME      AGE  REQUESTOR                                     CONDITION
csr-8b2br 15m  system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
```

```
csr-8vnps 15m system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

#### NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

#### NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}
{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

#### NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{"\n"}\n{{end}}{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

### Example output

```
NAME      STATUS   ROLES    AGE   VERSION
master-0  Ready    master   73m   v1.22.1
master-1  Ready    master   73m   v1.22.1
master-2  Ready    master   74m   v1.22.1
worker-0  Ready    worker   11m   v1.22.1
worker-1  Ready    worker   11m   v1.22.1
```

### NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

## 4.13.20. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

## Prerequisites

- Your control plane has initialized.

## Procedure

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

## Example output

NAME	VERSION	AVAILABLE	PROGRESSING	DEGRADED	SINCE
authentication	4.9.0	True	False	False	19m
baremetal	4.9.0	True	False	False	37m
cloud-credential	4.9.0	True	False	False	40m
cluster-autoscaler	4.9.0	True	False	False	37m
config-operator	4.9.0	True	False	False	38m
console	4.9.0	True	False	False	26m
csi-snapshot-controller	4.9.0	True	False	False	37m
dns	4.9.0	True	False	False	37m
etcd	4.9.0	True	False	False	36m
image-registry	4.9.0	True	False	False	31m
ingress	4.9.0	True	False	False	30m
insights	4.9.0	True	False	False	31m
kube-apiserver	4.9.0	True	False	False	26m
kube-controller-manager	4.9.0	True	False	False	36m
kube-scheduler	4.9.0	True	False	False	36m
kube-storage-version-migrator	4.9.0	True	False	False	37m
machine-api	4.9.0	True	False	False	29m
machine-approver	4.9.0	True	False	False	37m
machine-config	4.9.0	True	False	False	36m
marketplace	4.9.0	True	False	False	37m
monitoring	4.9.0	True	False	False	29m
network	4.9.0	True	False	False	38m
node-tuning	4.9.0	True	False	False	37m
openshift-apiserver	4.9.0	True	False	False	32m
openshift-controller-manager	4.9.0	True	False	False	30m
openshift-samples	4.9.0	True	False	False	32m
operator-lifecycle-manager	4.9.0	True	False	False	37m
operator-lifecycle-manager-catalog	4.9.0	True	False	False	37m
operator-lifecycle-manager-packageserver	4.9.0	True	False	False	32m
service-ca	4.9.0	True	False	False	38m
storage	4.9.0	True	False	False	37m

2. Configure the Operators that are not available.

### 4.13.20.1. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

### Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
  -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

### TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

## 4.13.20.2. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

### 4.13.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

### Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY\_STORAGE\_S3\_ACCESSKEY**
  - **REGISTRY\_STORAGE\_S3\_SECRETKEY**

### Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.

- Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

### Example configuration

```
storage:
  s3:
    bucket: <bucket-name>
    region: <region-name>
```

#### WARNING

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

#### 4.13.20.2.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

#### Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}'
```

#### WARNING

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

#### 4.13.21. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

## Prerequisites

- You completed the initial Operator configuration for your cluster.

## Procedure

1. Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):

- Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

- 1** **<name>** is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

### 4.13.22. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

## Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

## Procedure

1. Determine the routes to create.
  - To create a wildcard record, use **\*.apps.<cluster\_name>.<domain\_name>**, where **<cluster\_name>** is your cluster name, and **<domain\_name>** is the Route 53 base domain for your OpenShift Container Platform cluster.
  - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host} {"\n"}{end}{end}' routes
```

### Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
```

```

alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
grafana-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>

```

- Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

### Example output

```

NAME          TYPE          CLUSTER-IP    EXTERNAL-IP          PORT(S)
AGE
router-default LoadBalancer  172.30.62.215  ab3...28.us-east-2.elb.amazonaws.com
80:31499/TCP,443:30693/TCP  5m

```

- Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName == "<external_ip>").CanonicalHostedZoneNameID' 1
```

- For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

### Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

- Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
  --dns-name "<domain_name>" 1 \
  --query 'HostedZones[? Config.PrivateZone != `true` && Name == \
  `<domain_name>.`].Id' 2 \
  --output text
```

- For **<domain\_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

### Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

- Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
```

```

change-batch '{ ❶
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", ❷
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", ❸
>       "DNSName": "<external_ip>.", ❹
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'

```

- ❶ For **<private\_hosted\_zone\_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- ❷ For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- ❸ For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- ❹ For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```

$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{ ❶
> "Changes": [
> {
>   "Action": "CREATE",
>   "ResourceRecordSet": {
>     "Name": "\\052.apps.<cluster_domain>", ❷
>     "Type": "A",
>     "AliasTarget":{
>       "HostedZoneId": "<hosted_zone_id>", ❸
>       "DNSName": "<external_ip>.", ❹
>       "EvaluateTargetHealth": false
>     }
>   }
> }
> ]
> }'

```

- ❶ For **<public\_hosted\_zone\_id>**, specify the public hosted zone for your domain.
- ❷ For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.

- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

### 4.13.23. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

#### Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

#### Procedure

1. From the directory that contains the installation program, complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

#### Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Fe5en-ymBEc-
Wt6NL"
INFO Time elapsed: 1s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Register your cluster on the [Cluster registration](#) page.

### 4.13.24. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

#### Example output

-

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.13.25. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 4.13.26. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

### 4.13.27. Next steps

- [Validate an installation.](#)
- [Customize your cluster.](#)
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#) .
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.14. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

### 4.14.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

## NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

### Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

### Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$ ./openshift-install destroy cluster \
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

## NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

2. Optional: Delete the **<installation\_directory>** directory and the OpenShift Container Platform installation program.

### 4.14.2. Deleting AWS resources with the Cloud Credential Operator utility

To clean up resources after uninstalling an OpenShift Container Platform cluster with the Cloud Credential Operator (CCO) in manual mode with STS, you can use the CCO utility (**ccoctl**) to remove the AWS resources that **ccoctl** created during installation.

### Prerequisites

- Extract and prepare the **ccoctl** binary.
- Install an OpenShift Container Platform cluster with the CCO in manual mode with STS.

### Procedure

- Delete the AWS resources that **ccoctl** created:

```
$ ccoctl aws delete --name=<name> --region=<aws_region>
```

where:

- **<name>** matches the name used to originally create and tag the cloud resources.
- **<aws-region>** is the AWS region in which cloud resources will be deleted.

### Example output:

```
2021/04/08 17:50:41 Identity Provider object .well-known/openid-configuration deleted
from the bucket <name>-oidc
2021/04/08 17:50:42 Identity Provider object keys.json deleted from the bucket <name>-
oidc
2021/04/08 17:50:43 Identity Provider bucket <name>-oidc deleted
2021/04/08 17:51:05 Policy <name>-openshift-cloud-credential-operator-cloud-
credential-o associated with IAM Role <name>-openshift-cloud-credential-operator-
cloud-credential-o deleted
2021/04/08 17:51:05 IAM Role <name>-openshift-cloud-credential-operator-cloud-
credential-o deleted
2021/04/08 17:51:07 Policy <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
associated with IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials

2021/04/08 17:51:11 Policy <name>-openshift-machine-api-aws-cloud-credentials
associated with IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
2021/04/08 17:51:11 IAM Role <name>-openshift-machine-api-aws-cloud-credentials
deleted
2021/04/08 17:51:39 Identity Provider with ARN arn:aws:iam::<aws_account_id>:oidc-
provider/<name>-oidc.s3.<aws_region>.amazonaws.com deleted
```

### Verification

You can verify that the resources are deleted by querying AWS. For more information, refer to AWS documentation.

## CHAPTER 5. INSTALLING ON AZURE

### 5.1. PREPARING TO INSTALL ON AZURE

#### 5.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 5.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See [Configuring an Azure account](#) for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for Azure](#) for other options.

#### 5.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when

creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

### 5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

### 5.1.4. Next steps

- [Configuring an Azure account](#)

## 5.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 5.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

### IMPORTANT

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Default Azure limit	Description
vCPU	40	20 per region	<p>A default cluster requires 40 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>● One bootstrap machine, which is removed after installation</li> <li>● Three control plane machines</li> <li>● Three compute machines</li> </ul> <p>Because the bootstrap machine uses <b>Standard_D4s_v3</b> machines, which use 4 vCPUs, the control plane machines use <b>Standard_D8s_v3</b> virtual machines, which use 8 vCPUs, and the worker machines use <b>Standard_D4s_v3</b> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p> <p>By default, the installation program distributes control plane and compute machines across <a href="#">all availability zones</a> within a <a href="#">region</a>. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.</p>

Component	Number of components required by default	Default Azure limit	Description				
OS Disk	7		<p>VM OS disk must be able to sustain a tested and recommended minimum throughput of 5000 IOPS / 200MBps for control plane machines. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by <b>Standard_D8s_v3</b>, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required.</p> <p>Host caching must be set to <b>ReadOnly</b> for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</p>				
VNet	1	1000 per region	Each default cluster requires one Virtual Network (VNet), which contains two subnets.				
Network interfaces	7	65,536 per region	Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.				
Network security groups	2	5000	<p>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tbody> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </tbody> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere						
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443						

Component	Number of components required by default	Default Azure limit	Description						
Network load balancers	3	1000 per region	<p>Each cluster creates the following <a href="#">load balancers</a>:</p> <table border="1"> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines								
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines								
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines								
Public IP addresses	3		Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7		The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						
Spot VM vCPUs (optional)	0 If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node.	20 per region	<p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div>						

### 5.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

#### NOTE

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

### 5.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

#### NOTE

You can increase only one type of quota per support request.

#### Procedure

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
  - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
  - b. From the **Subscription** list, select the subscription to modify.
  - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
  - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
  - a. Click **Provide details** and provide the required details in the **Quota details** window.
  - b. In the **SUPPORT METHOD** and **CONTACT INFO** sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

### 5.2.4. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Contributor**

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

## 5.2.5. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

### Prerequisites

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

### Procedure

1. Log in to the Azure CLI:

```
$ az login
```

2. If your Azure account uses subscriptions, ensure that you are using the right subscription:
  - a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

### Example output

```
[
  {
    "cloudName": "AzureCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

### Example output

```
{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

**1** Ensure that the value of the **tenantId** parameter is the correct subscription ID.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> 1
```

**1** Specify the subscription ID.

- d. Verify the subscription ID update:

```
$ az account show
```

### Example output

```
{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

- Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.
- Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ 1
--scopes /subscriptions/<subscription_id> 2
--years <years> 3
```

- 1** Specify the service principal name.
- 2** Specify the subscription ID.
- 3** Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

### Example output

```
Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not
include these credentials in your code or check the credentials into your source
control. For more information, see https://aka.ms/azadsp-cli
{
  "appId": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}
```

5. Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.
6. Assign the **User Access Administrator** role by running the following command:

```
$ az role assignment create --role "User Access Administrator" \
--assignee-object-id $(az ad sp show --id <appId> --query id -o tsv) 1
```

- 1** Specify the **appId** parameter value for your service principal.

### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

### 5.2.6. Supported Azure Marketplace regions

Installing a cluster by using the Azure Marketplace image is available to customers who purchase the offer in North America and EMEA.

While the offer must be purchased in North America or EMEA, you can deploy the cluster to any of the Azure public partitions that OpenShift Container Platform supports.

#### NOTE

Deploying a cluster by using the Azure Marketplace image is not supported for the Azure Government regions.

## 5.2.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

### Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **qatarcentral** (Qatar Central)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **switzerlandnorth** (Switzerland North)

- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)

### Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 5.2.8. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can [install a customized cluster](#) or [quickly install a cluster](#) with default options.

## 5.3. MANUALLY CREATING IAM FOR AZURE

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

### 5.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can set the **credentialsMode** parameter for the CCO to **Manual** when installing OpenShift Container Platform and manage your cloud credentials manually.

Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

## Additional resources

- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

### 5.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

#### Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

#### Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

#### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
  --credentials-requests \
  --cloud=azure
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
    ...
```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
    ...
  secretRef:
    name: <component-secret>
    namespace: <component-namespace>
  ...
```

### Sample **Secret** object

```
apiVersion: v1
kind: Secret
metadata:
```

```

name: <component-secret>
namespace: <component-namespace>
data:
  azure_subscription_id: <base64_encoded_azure_subscription_id>
  azure_client_id: <base64_encoded_azure_client_id>
  azure_client_secret: <base64_encoded_azure_client_secret>
  azure_tenant_id: <base64_encoded_azure_tenant_id>
  azure_resource_prefix: <base64_encoded_azure_resource_prefix>
  azure_resourcegroup: <base64_encoded_azure_resourcegroup>
  azure_region: <base64_encoded_azure_region>

```

## IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

### 5.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.8 to 4.9, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.
- For z-stream releases, for example, from 4.9.0 to 4.9.1, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

#### Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release. The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.
2. Update the manually maintained credentials on your cluster:
  - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
  - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.
3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:
  - a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.

- b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

#### Text to add

```
...
metadata:
  annotations:
    cloudcredential.openshift.io/upgradeable-to: <version_number>
...
```

Where **<version\_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
  - a. In the **Administrator** perspective of the web console, navigate to **Administration** → **Cluster Settings**.
  - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
  - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

### 5.3.4. Next steps

- Install an OpenShift Container Platform cluster:
  - [Installing a cluster quickly on Azure](#) with default options on installer-provisioned infrastructure
  - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)

## 5.4. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.9, you can install a cluster on Microsoft Azure that uses the default configuration options.

### 5.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.4.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **azure** as the platform to target.
- c. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantid** value in your account output.
  - **azure service principal client id** The value of the **appid** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- d. Select the region to deploy the cluster to.
- e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- f. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- g. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

**NOTE**

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

**Example output**

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
```

INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-Wt5AL"  
 INFO Time elapsed: 36m22s

#### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.4.9. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.9, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### 5.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the

installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.5.4. Selecting an Azure Marketplace image**

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.
- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

**Prerequisites**

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

## Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

### Example output

Offer	Publisher	Skus	Urn	Version
rh-ocp-worker-ocpworker:4.8.2021122100	RedHat	rh-ocp-worker	RedHat:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	
rh-ocp-worker-gen1:4.8.2021122100	RedHat	rh-ocp-worker-gen1	RedHat:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

### Example output

Offer	Publisher	Skus	Urn	Version
rh-ocp-worker-worker:4.8.2021122100	redhat-limited	rh-ocp-worker	redhat-limited:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	
rh-ocp-worker-gen1:4.8.2021122100	redhat-limited	rh-ocp-worker-gen1	redhat-limited:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	

## NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

- North America:

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

3. Review the terms of the offer by running one of the following commands:

- North America:

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

4. Accept the terms of the offering by running one of the following commands:

- North America:

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

5. Record the image details of your offer. You must update the **99\_openshift-cluster-api\_worker\_machineset-[0-2].yaml** files in the section titled "Updating Manifests for Marketplace Installation" before completing the installation.

### 5.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

## IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

## IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

**5.5.6.1. Installation configuration parameters**

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 5.5.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 5.1. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .

Parameter	Description	Values
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

#### 5.5.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.2. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	<p>Object</p>  <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p>

Parameter	Description	Values
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation. For example, <b>10.0.0.0/16</b> .  <b>NOTE</b> Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.

### 5.5.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.3. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 510 595 864" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p> <div data-bbox="485 909 595 1263" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.5.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.4. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .

Parameter	Description	Values
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .

Parameter	Description	Values
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

**5.5.6.2. Minimum resource requirements for cluster installation**

Each cluster machine must meet the following minimum requirements:

**Table 5.5. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

**5.5.6.3. Sample customized install-config.yaml file for Azure**

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:

```

```

baseDomainResourceGroupName: resource_group 11
region: centralus 12
resourceGroupName: existing_resource_group 13
outboundType: Loadbalancer
cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 14
fips: false 15
sshKey: ssh-ed25519 AAAA... 16

```

- 1 10 12 14 Required. The installation program prompts you for this value.
- 2 6 If you do not provide these parameters and values, the installation program provides the default value.
- 3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 15 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

**5.5.6.4. Configuring the cluster-wide proxy during installation**

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

**Prerequisites**

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

**Procedure**

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.

- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.5.7. Updating manifests for Marketplace installation

If you selected a Marketplace image for installation, you must create and modify the manifests to use the Marketplace image.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

#### Procedure

1. Change to the directory that contains the installation program and create the manifests by running the following command:

```
$ openshift-install create manifests --dir <installation_dir>
```

2. Edit the **.spec.template.spec.providerSpec.value.image** property of the compute machine set definitions, replacing the **offer**, **publisher**, **sku**, and **version** values with the details gathered in the section titled "Selecting an Azure Marketplace image". These are the three files that must be updated:

- **<installation\_dir>/openshift/99\_openshift-cluster-api\_worker-machineset-0.yaml**
- **<installation\_dir>/openshift/99\_openshift-cluster-api\_worker-machineset-1.yaml**
- **<installation\_dir>/openshift/99\_openshift-cluster-api\_worker-machineset-2.yaml**

- In each file, replace the value of the `.spec.template.spec.providerSpec.value.image.resourceID` property with an empty value (`""`).
- In each file, set the `type` property to `MarketplaceWithPlan`.
- Using the first machine set file as an example, the `.spec.template.spec.providerSpec.value.image` section must look like the following example:

```
image:
  offer: rh-ocp-worker
  publisher: redhat
  resourceID: ""
  sku: rh-ocp-worker
  version: 4.8.2021122100
  type: MarketplaceWithPlan
```

### 5.5.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the `create cluster` command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
- 2** To view different installation details, specify `warn`, `debug`, or `error` instead of `info`.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

## 5.5.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.5.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.5.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.5.12. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.9, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### 5.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#). Manual mode can also be used in environments where the cloud IAM APIs are not reachable.

### 5.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.
- iv. Select the region to deploy the cluster to.

- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 5.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 5.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.6. Required parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> , <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 5.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.7. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <div style="margin-left: 20px;"> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 5.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.8. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <div data-bbox="485 510 595 862" style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">  </div> <p><b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <div data-bbox="485 909 595 1261" style="border: 1px solid black; padding: 5px;">  </div> <p><b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.6.5.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.9. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .

Parameter	Description	Values
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zones</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .

Parameter	Description	Values
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 5.6.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.10. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

**5.6.5.3. Sample customized install-config.yaml file for Azure**

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:

```

```

azure:
  baseDomainResourceGroupName: resource_group 12
  region: centralus 13
  resourceGroupName: existing_resource_group 14
  outboundType: Loadbalancer
  cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 15
fips: false 16
sshKey: ssh-ed25519 AAAA... 17

```

- 1 10 13 15 Required. The installation program prompts you for this value.
- 2 6 11 If you do not provide these parameters and values, the installation program provides the default value.
- 3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 12 Specify the name of the resource group that contains the DNS zone for your base domain.
- 14 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 16 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 17 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

**5.6.5.4. Configuring the cluster-wide proxy during installation**

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

**Prerequisites**

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

**Procedure**

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.

- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.6.6. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

#### Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 5.6.7. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

#### IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

#### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

#### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

```

defaultNetwork:
  openshiftSDNConfig:
    vxlanPort: 4800

```

### Enable IPsec for the OVN-Kubernetes network provider

```

apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}

```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

## 5.6.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

### **clusterNetwork**

IP address pools from which pod IP addresses are allocated.

### **serviceNetwork**

IP address pool for services.

### **defaultNetwork.type**

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

### 5.6.8.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 5.11. Cluster Network Operator configuration object**

Field	Type	Description
<b>metadata.name</b>	<b>string</b>	The name of the CNO object. This name is always <b>cluster</b> .

Field	Type	Description
<b>spec.clusterNetwork</b>	<b>array</b>	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:   - cidr: 10.128.0.0/19     hostPrefix: 23   - cidr: 10.128.32.0/19     hostPrefix: 23</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.serviceNetwork</b>	<b>array</b>	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:   - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.defaultNetwork</b>	<b>object</b>	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
<b>spec.kubeProxy Config</b>	<b>object</b>	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

### defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 5.12. **defaultNetwork** object

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>type</b>	<b>string</b>	<p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
<b>openshiftSDNConfig</b>	<b>object</b>	This object is only valid for the OpenShift SDN cluster network provider.
<b>ovnKubernetesConfig</b>	<b>object</b>	This object is only valid for the OVN-Kubernetes cluster network provider.

#### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

**Table 5.13. openshiftSDNConfig object**

Field	Type	Description
<b>mode</b>	<b>string</b>	<p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>vxlanPort</b>	<b>integer</b>	<p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>

### Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 5.14. `ovnKubernetesConfig` object

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>genevePort</b>	<b>integer</b>	The port to use for all Geneve packets. The default value is <b>6081</b> . This value cannot be changed after cluster installation.
<b>ipsecConfig</b>	<b>object</b>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<b>policyAuditConfig</b>	<b>object</b>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Table 5.15. **policyAuditConfig** object

Field	Type	Description
<b>rateLimit</b>	integer	The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second.
<b>maxFileSize</b>	integer	The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.

Field	Type	Description
<b>destination</b>	string	<p>One of the following additional audit log targets:</p> <p><b>libc</b> The libc <b>syslog()</b> function of the journald process on the host.</p> <p><b>udp:&lt;host&gt;:&lt;port&gt;</b> A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server.</p> <p><b>unix:&lt;file&gt;</b> A Unix Domain Socket file specified by <b>&lt;file&gt;</b>.</p> <p><b>null</b> Do not send the audit logs to any additional target.</p>
<b>syslogFacility</b>	string	The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .

### Example OVN-Kubernetes configuration

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

### kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 5.16. **kubeProxyConfig** object

Field	Type	Description
<b>iptablesSyncPeriod</b>	<b>string</b>	<p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 2;"> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div>

Field	Type	Description
<b>proxyArguments.iptables-min-sync-period</b>	<b>array</b>	<p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>

### 5.6.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with OVN-Kubernetes. This allows a hybrid cluster that supports different node networking configurations. For example, this is necessary to run both Linux and Windows nodes in a cluster.

#### IMPORTANT

You must configure hybrid networking with OVN-Kubernetes during the installation of your cluster. You cannot switch to hybrid networking after the installation process.

#### Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

#### Procedure

- Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

■

where:

**<installation\_directory>**

Specifies the directory name that contains the **manifests/** directory for your cluster.

- Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

### Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
        hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

- Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.
- Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

#### NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

- Save the **cluster-network-03-config.yml** file and quit the text editor.
- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

#### NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

## 5.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

## IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

## NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 5.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 5.6.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 5.6.14. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 5.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET

In OpenShift Container Platform version 4.9, you can install a cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.7.2. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.9, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

#### 5.7.2.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the

cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

#### NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

#### 5.7.2.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

#### IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.17. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x

Port	Description	Control plane	Compute
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

## IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### Additional resources

- [About the OpenShift SDN network plugin](#)

### 5.7.2.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

### 5.7.2.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

## 5.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

Identity added: /home/<you>/<path>/<file\_name> (<computer\_name>)

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 5.7.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 5.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

## Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
- iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
  - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
  - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
  - **azure service principal client id** The value of the **appId** parameter for the service principal.
  - **azure service principal client secret** The value of the **password** parameter for the service principal.

- iv. Select the region to deploy the cluster to.
- v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- vi. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 5.7.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 5.7.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 5.18. Required parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}.{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 5.7.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.19. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 5.7.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.20. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b>  If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hypertreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="485 1093 592 1411" style="background-color: black; width: 67px; height: 142px; margin-bottom: 10px;"></div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start; gap: 10px;"> <div style="width: 60px; height: 150px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; gap: 10px; margin-top: 10px;"> <div style="width: 60px; height: 80px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.7.6.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.21. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .

Parameter	Description	Values
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .

Parameter	Description	Values
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

**5.7.6.2. Minimum resource requirements for cluster installation**

Each cluster machine must meet the following minimum requirements:

**Table 5.22. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

**5.7.6.3. Sample customized install-config.yaml file for Azure**

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:

```

```

baseDomainResourceGroupName: resource_group 11
region: centralus 12
resourceGroupName: existing_resource_group 13
networkResourceGroupName: vnet_resource_group 14
virtualNetwork: vnet 15
controlPlaneSubnet: control_plane_subnet 16
computeSubnet: compute_subnet 17
outboundType: Loadbalancer
cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 18
fips: false 19
sshKey: ssh-ed25519 AAAA... 20

```

- 1 10 12 18 Required. The installation program prompts you for this value.
- 2 6 If you do not provide these parameters and values, the installation program provides the default value.
- 3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 Whether to enable or disable simultaneous multithreading, or **hypertreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

- 5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.
- 9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.
- 11 Specify the name of the resource group that contains the DNS zone for your base domain.
- 13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 14 If you use an existing VNet, specify the name of the resource group that contains it.
- 15 If you use an existing VNet, specify its name.
- 16 If you use an existing VNet, specify the name of the subnet to host the control plane machines.
- 17 If you use an existing VNet, specify the name of the subnet to host the compute machines.
- 19 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container

Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

20

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 5.7.6.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
```

```

noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2** A proxy URL to use for creating HTTPS connections outside the cluster.
- 3** A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4** If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.7.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/./openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 5.7.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.7.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 5.7.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 5.7.11. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 5.8. INSTALLING A PRIVATE CLUSTER ON AZURE

In OpenShift Container Platform version 4.9, you can install a private cluster into an existing Azure Virtual Network (VNet) on Microsoft Azure. The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.8.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

#### IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 5.8.2.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster's private DNS records. The cluster's machines use **168.63.129.16** internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 5.8.2.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

#### 5.8.2.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the **install-config.yaml** file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an internal registry mirror.

- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the *Configuring your firewall* section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

#### Private cluster with network address translation

You can use [Azure VNET network address translation \(NAT\)](#) to provide outbound internet access for the subnets in your cluster. You can reference [Create a NAT gateway using Azure CLI](#) in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

#### Private cluster with Azure Firewall

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about [providing user-defined routing with Azure Firewall](#) in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

#### Private cluster with a proxy configuration

You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with **0.0.0.0/0** populated automatically by Azure, all Azure API requests are routed over Azure's internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

#### Private cluster with no internet access

You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

### 5.8.3. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.9, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

### 5.8.3.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for.

#### NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

### 5.8.3.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

#### IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.23. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

#### IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

#### Additional resources

- [About the OpenShift SDN network plugin](#)

### 5.8.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different

resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

### 5.8.3.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

### 5.8.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.8.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.8.6. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

## IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.8.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

## IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

## NOTE

You must name this configuration file **install-config.yaml**.

**NOTE**

For some platform types, you can alternatively run `./openshift-install create install-config --dir <installation_directory>` to generate an `install-config.yaml` file. You can provide details about your cluster configuration at the prompts.

3. Back up the `install-config.yaml` file so that you can use it to install multiple clusters.

**IMPORTANT**

The `install-config.yaml` file is consumed during the next step of the installation process. You must back it up now.

**5.8.7.1. Installation configuration parameters**

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the `install-config.yaml` installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the `install-config.yaml` file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the `install-config.yaml` file.

**IMPORTANT**

The `openshift-install` command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

**5.8.7.1.1. Required configuration parameters**

Required installation configuration parameters are described in the following table:

**Table 5.24. Required parameters**

Parameter	Description	Values
<code>apiVersion</code>	The API version for the <code>install-config.yaml</code> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre> {   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } } </pre>

### 5.8.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 5.25. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object   <b>NOTE</b> You cannot modify parameters specified by the <b>networking</b> object after installation.
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:   networking: clusterNetwork: - cidr: <b>10.128.0.0/14</b> hostPrefix: <b>23</b>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .

Parameter	Description	Values
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

### 5.8.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.26. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.

Parameter	Description	Values
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b> , on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.   <b>IMPORTANT</b> If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hypert hreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p>  <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platfor m</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replica s</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.8.7.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.27. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .

Parameter	Description	Values
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zones</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .

Parameter	Description	Values
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

### 5.8.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.28. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

**5.8.7.3. Sample customized install-config.yaml file for Azure**

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:

```

```

baseDomainResourceGroupName: resource_group 11
region: centralus 12
resourceGroupName: existing_resource_group 13
networkResourceGroupName: vnet_resource_group 14
virtualNetwork: vnet 15
controlPlaneSubnet: control_plane_subnet 16
computeSubnet: compute_subnet 17
outboundType: UserDefinedRouting 18
cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 19
fips: false 20
sshKey: ssh-ed25519 AAAA... 21
publish: Internal 22

```

1 10 12 19 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11 Specify the name of the resource group that contains the DNS zone for your base domain.

13 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

14 If you use an existing VNet, specify the name of the resource group that contains it.

15 If you use an existing VNet, specify its name.

16 If you use an existing VNet, specify the name of the subnet to host the control plane machines.

17 If you use an existing VNet, specify the name of the subnet to host the compute machines.

- 18 You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 5.8.7.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.8.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

## IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

## NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

**5.8.9. Installing the OpenShift CLI by downloading the binary**

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

**Installing the OpenShift CLI on Linux**

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

**Procedure**

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.8.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container

Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 5.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 5.8.12. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.9, you can install a cluster on Microsoft Azure into a government region. To configure the government region, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated government region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 5.9.2. Azure government regions

OpenShift Container Platform supports deploying a cluster to [Microsoft Azure Government \(MAG\)](#) regions. MAG is specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure. MAG is composed of government-only data center regions, all granted an [Impact Level 5 Provisional Authorization](#).

Installing to a MAG region requires manually configuring the Azure Government dedicated cloud instance and region in the **install-config.yaml** file. You must also update your service principal to reference the appropriate government environment.

#### NOTE

The Azure government region cannot be selected using the guided terminal prompts from the installation program. You must define the region manually in the **install-config.yaml** file. Remember to also set the dedicated cloud instance, like **AzureUSGovernmentCloud**, based on the region specified.

### 5.9.3. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

## IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 5.9.3.1. Private clusters in Azure

To create a private cluster on Microsoft Azure, you must provide an existing private VNet and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

Depending how your network connects to the private VNET, you might need to use a DNS forwarder to resolve the cluster's private DNS records. The cluster's machines use **168.63.129.16** internally for DNS resolution. For more information, see [What is Azure Private DNS?](#) and [What is IP address 168.63.129.16?](#) in the Azure documentation.

The cluster still requires access to internet to access the Azure APIs.

The following items are not required or created when you install a private cluster:

- A **BaseDomainResourceGroup**, since the cluster does not create public records
- Public IP addresses
- Public DNS records
- Public endpoints

The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

#### 5.9.3.1.1. Limitations

Private clusters on Azure are subject to only the limitations that are associated with the use of an existing VNet.

### 5.9.3.2. User-defined outbound routing

In OpenShift Container Platform, you can choose your own outbound routing for a cluster to connect to the internet. This allows you to skip the creation of public IP addresses and the public load balancer.

You can configure user-defined routing by modifying parameters in the **install-config.yaml** file before installing your cluster. A pre-existing VNet is required to use outbound routing when installing a cluster; the installation program is not responsible for configuring this.

When configuring a cluster to use user-defined routing, the installation program does not create the following resources:

- Outbound rules for access to the internet.
- Public IPs for the public load balancer.
- Kubernetes Service object to add the cluster machines to the public load balancer for outbound requests.

You must ensure the following items are available before setting user-defined routing:

- Egress to the internet is possible to pull container images, unless using an internal registry mirror.
- The cluster can access Azure APIs.
- Various allowlist endpoints are configured. You can reference these endpoints in the *Configuring your firewall* section.

There are several pre-existing networking setups that are supported for internet access using user-defined routing.

#### Private cluster with network address translation

You can use [Azure VNET network address translation \(NAT\)](#) to provide outbound internet access for the subnets in your cluster. You can reference [Create a NAT gateway using Azure CLI](#) in the Azure documentation for configuration instructions.

When using a VNet setup with Azure NAT and user-defined routing configured, you can create a private cluster with no public endpoints.

#### Private cluster with Azure Firewall

You can use Azure Firewall to provide outbound routing for the VNet used to install the cluster. You can learn more about [providing user-defined routing with Azure Firewall](#) in the Azure documentation.

When using a VNet setup with Azure Firewall and user-defined routing configured, you can create a private cluster with no public endpoints.

#### Private cluster with a proxy configuration

You can use a proxy with user-defined routing to allow egress to the internet. You must ensure that cluster Operators do not access Azure APIs using a proxy; Operators must have access to Azure APIs outside of the proxy.

When using the default route table for subnets, with **0.0.0.0/0** populated automatically by Azure, all Azure API requests are routed over Azure's internal network even though the IP addresses are public. As long as the Network Security Group rules allow egress to Azure API endpoints, proxies with user-defined routing configured allow you to create private clusters with no public endpoints.

### Private cluster with no internet access

You can install a private network that restricts all access to the internet, except the Azure API. This is accomplished by mirroring the release image registry locally. Your cluster must have access to the following:

- An internal registry mirror that allows for pulling container images
- Access to Azure APIs

With these requirements available, you can use user-defined routing to create private clusters with no public endpoints.

## 5.9.4. About reusing a VNet for your OpenShift Container Platform cluster

In OpenShift Container Platform 4.9, you can deploy a cluster into an existing Azure Virtual Network (VNet) in Microsoft Azure. If you do, you must also use existing subnets within the VNet and routing rules.

By deploying OpenShift Container Platform into an existing Azure VNet, you might be able to avoid service limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VNet.

### 5.9.4.1. Requirements for using your VNet

When you deploy a cluster by using an existing VNet, you must perform additional network configuration before you install the cluster. In installer-provisioned infrastructure clusters, the installer usually creates the following components, but it does not create them when you install into an existing VNet:

- Subnets
- Route tables
- VNets
- Network Security Groups

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VNet, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VNet options like DHCP, so you must do so before you install the cluster.

The cluster must be able to access the resource group that contains the existing VNet and subnets. While all of the resources that the cluster creates are placed in a separate resource group that it creates, some network resources are used from a separate group. Some cluster Operators must be able to access resources in both resource groups. For example, the Machine API controller attaches NICS for the virtual machines that it creates to subnets from the networking resource group.

Your VNet must meet the following characteristics:

- The VNet's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines.
- The VNet and its subnets must belong to the same resource group, and the subnets must be configured to use Azure-assigned DHCP IP addresses instead of static IP addresses.

You must provide two subnets within your VNet, one for the control plane machines and one for the compute machines. Because Azure distributes machines in different availability zones within the region that you specify, your cluster will have high availability by default.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the specified subnets exist.
- There are two private subnets, one for the control plane machines and one for the compute machines.
- The subnet CIDRs belong to the machine CIDR that you specified. Machines are not provisioned in availability zones that you do not provide private subnets for. If required, the installation program creates public load balancers that manage the control plane and worker nodes, and Azure allocates a public IP address to them.

#### NOTE

If you destroy a cluster that uses an existing VNet, the VNet is not deleted.

#### 5.9.4.1.1. Network security group requirements

The network security groups for the subnets that host the compute and control plane machines require specific access to ensure that the cluster communication is correct. You must create rules to allow access to the required cluster communication ports.

#### IMPORTANT

The network security group rules must be in place before you install the cluster. If you attempt to install a cluster without the required access, the installation program cannot reach the Azure APIs, and installation fails.

Table 5.29. Required ports

Port	Description	Control plane	Compute
80	Allows HTTP traffic		x
443	Allows HTTPS traffic		x
6443	Allows communication to the control plane machines	x	
22623	Allows internal communication to the machine config server for provisioning machines	x	

## IMPORTANT

Currently, there is no supported way to block or restrict the machine config server endpoint. The machine config server must be exposed to the network so that newly-provisioned machines, which have no existing configuration or state, are able to fetch their configuration. In this model, the root of trust is the certificate signing requests (CSR) endpoint, which is where the kubelet sends its certificate signing request for approval to join the cluster. Because of this, machine configs should not be used to distribute sensitive information, such as secrets and certificates.

To ensure that the machine config server endpoints, ports 22623 and 22624, are secured in bare metal scenarios, customers must configure proper network policies.

Because cluster components do not modify the user-provided network security groups, which the Kubernetes controllers update, a pseudo-network security group is created for the Kubernetes controller to modify without impacting the rest of the environment.

### Additional resources

- [About the OpenShift SDN network plugin](#)

#### 5.9.4.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, storage, and load balancers, but not networking-related components such as VNets, subnet, or ingress rules.

The Azure credentials that you use when you create your cluster do not need the networking permissions that are required to make VNets and core networking components within the VNet, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage accounts, and nodes.

#### 5.9.4.3. Isolation between clusters

Because the cluster is unable to modify network security groups in an existing subnet, there is no way to isolate clusters from each other on the VNet.

#### 5.9.5. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.9.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

## IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

## NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

## NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

#### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.9.7. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

## Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.9.8. Manually creating the installation configuration file

When installing OpenShift Container Platform on Microsoft Azure into a government region, you must manually generate your installation configuration file.

## Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

### NOTE

You must name this configuration file **install-config.yaml**.

### NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation\_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

## 5.9.8.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

### 5.9.8.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 5.30. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 5.9.8.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**Table 5.31. Network parameters**

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.network Type</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 5.9.8.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 5.32. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="486 1093 593 1411" style="background-color: black; width: 67px; height: 142px; margin-bottom: 10px;"></div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference content</i>.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 5.9.8.1.4. Additional Azure configuration parameters

Additional Azure configuration parameters are described in the following table:

Table 5.33. Additional Azure parameters

Parameter	Description	Values
<b>compute.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>128</b> .
<b>compute.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>standard_LRS</b> , <b>premium_LRS</b> , or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>controlPlane.platform.azure.osDisk.diskSizeGB</b>	The Azure disk size for the VM.	Integer that represents the size of the disk in GB. The default is <b>1024</b> .
<b>controlPlane.platform.azure.osDisk.diskType</b>	Defines the type of disk.	<b>premium_LRS</b> or <b>standardSSD_LRS</b> . The default is <b>premium_LRS</b> .
<b>platform.azure.baseDomainResourceGroupName</b>	The name of the resource group that contains the DNS zone for your base domain.	String, for example <b>production_cluster</b> .

Parameter	Description	Values
<b>platform.azure.resourceGroupName</b>	The name of an already existing resource group to install your cluster to. This resource group must be empty and only used for this specific cluster; the cluster components assume ownership of all resources in the resource group. If you limit the service principal scope of the installation program to this resource group, you must ensure all other resources used by the installation program in your environment have the necessary permissions, such as the public DNS zone and virtual network. Destroying the cluster using the installation program deletes this resource group.	String, for example <b>existing_resource_group</b> .
<b>platform.azure.outboundType</b>	The outbound routing strategy used to connect your cluster to the internet. If you are using user-defined routing, you must have pre-existing networking available where the outbound routing has already been configured prior to installing a cluster. The installation program is not responsible for configuring user-defined routing.	<b>LoadBalancer</b> or <b>UserDefinedRouting</b> . The default is <b>LoadBalancer</b> .
<b>platform.azure.region</b>	The name of the Azure region that hosts your cluster.	Any valid region name, such as <b>centralus</b> .
<b>platform.azure.zone</b>	List of availability zones to place machines in. For high availability, specify at least two zones.	List of zones, for example <b>["1", "2", "3"]</b> .
<b>platform.azure.networkResourceGroupName</b>	The name of the resource group that contains the existing VNet that you want to deploy your cluster to. This name cannot be the same as the <b>platform.azure.baseDomainResourceGroupName</b> .	String.
<b>platform.azure.virtualNetwork</b>	The name of the existing VNet that you want to deploy your cluster to.	String.
<b>platform.azure.controlPlaneSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your control plane machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .

Parameter	Description	Values
<b>platform.azure.computeSubnet</b>	The name of the existing subnet in your VNet that you want to deploy your compute machines to.	Valid CIDR, for example <b>10.0.0.0/16</b> .
<b>platform.azure.cloudName</b>	The name of the Azure cloud environment that is used to configure the Azure SDK with the appropriate Azure API endpoints. If empty, the default value <b>AzurePublicCloud</b> is used.	Any valid cloud environment, such as <b>AzurePublicCloud</b> or <b>AzureUSGovernmentCloud</b> .

**NOTE**

You cannot customize [Azure Availability Zones](#) or [Use tags to organize your Azure resources](#) with an Azure cluster.

**5.9.8.2. Minimum resource requirements for cluster installation**

Each cluster machine must meet the following minimum requirements:

**Table 5.34. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

**IMPORTANT**

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

**5.9.8.3. Sample customized install-config.yaml file for Azure**

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2
  hyperthreading: Enabled 3 4
  name: master
  platform:
    azure:
      osDisk:
        diskSizeGB: 1024 5
        diskType: Premium_LRS
        type: Standard_D8s_v3
      replicas: 3
compute: 6
- hyperthreading: Enabled 7
  name: worker
  platform:
    azure:
      type: Standard_D2s_v3
      osDisk:
        diskSizeGB: 512 8
        diskType: Standard_LRS
      zones: 9
      - "1"
      - "2"
      - "3"
    replicas: 5
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:

```

```

baseDomainResourceGroupName: resource_group 11
region: usgovvirginia
resourceGroupName: existing_resource_group 12
networkResourceGroupName: vnet_resource_group 13
virtualNetwork: vnet 14
controlPlaneSubnet: control_plane_subnet 15
computeSubnet: compute_subnet 16
outboundType: UserDefinedRouting 17
cloudName: AzureUSGovernmentCloud 18
pullSecret: '{"auths": ...}' 19
fips: false 20
sshKey: ssh-ed25519 AAAA... 21
publish: Internal 22

```

1 10 19 Required.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11 Specify the name of the resource group that contains the DNS zone for your base domain.

12 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

13 If you use an existing VNet, specify the name of the resource group that contains it.

14 If you use an existing VNet, specify its name.

15 If you use an existing VNet, specify the name of the subnet to host the control plane machines.

16 If you use an existing VNet, specify the name of the subnet to host the compute machines.

- 17 You can customize your own outbound routing. Configuring user-defined routing prevents exposing external endpoints in your cluster. User-defined routing for egress requires deploying
- 18 Specify the name of the Azure cloud environment to deploy your cluster to. Set **AzureUSGovernmentCloud** to deploy to a Microsoft Azure Government (MAG) region. The default value is **AzurePublicCloud**.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 5.9.8.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.9.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.

- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
```

```

KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

## 5.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.9.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.9.13. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 5.10. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES

In OpenShift Container Platform version 4.9, you can install a cluster on Microsoft Azure by using infrastructure that you provide.

Several [Azure Resource Manager](#) (ARM) templates are provided to assist in completing these steps or to help model your own.

### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 5.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See [Install the Azure CLI](#) in the Azure documentation. The documentation below was last tested using version **2.38.0** of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### NOTE

Be sure to also review this site list if you are configuring a proxy.

### 5.10.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 5.10.3. Configuring your Azure project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 5.10.3.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

### IMPORTANT

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Default Azure limit	Description
vCPU	40	20 per region	<p>A default cluster requires 40 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>● One bootstrap machine, which is removed after installation</li> <li>● Three control plane machines</li> <li>● Three compute machines</li> </ul> <p>Because the bootstrap machine uses <b>Standard_D4s_v3</b> machines, which use 4 vCPUs, the control plane machines use <b>Standard_D8s_v3</b> virtual machines, which use 8 vCPUs, and the worker machines use <b>Standard_D4s_v3</b> virtual machines, which use 4 vCPUs, a default cluster requires 40 vCPUs. The bootstrap node VM, which uses 4 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p> <p>By default, the installation program distributes control plane and compute machines across <a href="#">all availability zones</a> within a <a href="#">region</a>. To ensure high availability for your cluster, select a region with at least three availability zones. If your region contains fewer than three availability zones, the installation program places more than one control plane machine in the available zones.</p>

Component	Number of components required by default	Default Azure limit	Description				
OS Disk	7		<p>VM OS disk must be able to sustain a tested and recommended minimum throughput of 5000 IOPS / 200MBps for control plane machines. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by <b>Standard_D8s_v3</b>, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required.</p> <p>Host caching must be set to <b>ReadOnly</b> for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</p>				
VNet	1	1000 per region	Each default cluster requires one Virtual Network (VNet), which contains two subnets.				
Network interfaces	7	65,536 per region	Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.				
Network security groups	2	5000	<p>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tbody> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </tbody> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere						
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443						

Component	Number of components required by default	Default Azure limit	Description						
Network load balancers	3	1000 per region	<p>Each cluster creates the following <a href="#">load balancers</a>:</p> <table border="1"> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines								
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines								
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines								
Public IP addresses	3		Each of the two public load balancers uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7		The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						
Spot VM vCPUs (optional)	0 If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node.	20 per region	<p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div>						

### 5.10.3.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

**NOTE**

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

You can view Azure's DNS solution by visiting this [example for creating DNS zones](#).

### 5.10.3.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
  - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
  - b. From the **Subscription** list, select the subscription to modify.
  - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
  - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
  - a. Click **Provide details** and provide the required details in the **Quota details** window.
  - b. In the **SUPPORT METHOD** and **CONTACT INFO** sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

### 5.10.3.4. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

### 5.10.3.5. Required Azure roles

OpenShift Container Platform needs a service principal so it can manage Microsoft Azure resources. Before you can create a service principal, your Azure account subscription must have the following roles:

- **User Access Administrator**
- **Contributor**

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

### 5.10.3.6. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

#### Prerequisites

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

#### Procedure

1. Log in to the Azure CLI:

```
$ az login
```

2. If your Azure account uses subscriptions, ensure that you are using the right subscription:
  - a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

#### Example output

```
[
  {
    "cloudName": "AzureCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
```

```

    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]

```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

### Example output

```

{
  "environmentName": "AzureCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}

```

- 1** Ensure that the value of the **tenantId** parameter is the correct subscription ID.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> 1
```

- 1** Specify the subscription ID.

- d. Verify the subscription ID update:

```
$ az account show
```

### Example output

```

{
  "environmentName": "AzureCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",

```

```

    "type": "user"
  }
}

```

- Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.
- Create the service principal for your account:

```

$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ 1
--scopes /subscriptions/<subscription_id> 2
--years <years> 3

```

- Specify the service principal name.
- Specify the subscription ID.
- Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

### Example output

```

Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not
include these credentials in your code or check the credentials into your source
control. For more information, see https://aka.ms/azadsp-cli
{
  "appId": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}

```

- Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.
- Assign the **User Access Administrator** role by running the following command:

```

$ az role assignment create --role "User Access Administrator" \
--assignee-object-id $(az ad sp show --id <appId> --query id -o tsv) 1

```

- Specify the **appId** parameter value for your service principal.

### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

#### 5.10.3.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

## Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)
- **qatarcentral** (Qatar Central)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)

- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)

#### Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 5.10.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

#### 5.10.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 5.35. Minimum required hosts**

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

#### IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 7.9, or RHEL 8.4.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 8 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

#### 5.10.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.36. Minimum resource requirements**

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

#### IMPORTANT

You are required to use Azure virtual machines with **premiumIO** set to **true**. The machines must also have the **hyperVGeneration** property contain **V1**.

#### 5.10.5. Selecting an Azure Marketplace image

If you are deploying an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.

- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you are going to use an instance type that is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

## Prerequisites

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

## Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

### Example output

Offer	Publisher	Sku	Urn	Version
rh-ocp-worker-ocpworker:4.8.2021122100	RedHat	rh-ocp-worker	RedHat:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	
rh-ocp-worker-gen1:4.8.2021122100	RedHat	rh-ocp-worker-gen1	RedHat:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

### Example output

Offer	Publisher	Sku	Urn	Version
rh-ocp-worker-worker:4.8.2021122100	redhat-limited	rh-ocp-worker	redhat-limited:rh-ocp-worker:rh-ocp-worker:4.8.2021122100	
rh-ocp-worker-gen1:4.8.2021122100	redhat-limited	rh-ocp-worker-gen1	redhat-limited:rh-ocp-worker:rh-ocp-worker-gen1:4.8.2021122100	

## NOTE

Regardless of the version of OpenShift Container Platform you are installing, the correct version of the Azure Marketplace image to use is 4.8.x. If required, as part of the installation process, your VMs are automatically upgraded.

2. Inspect the image for your offer by running one of the following commands:

- North America:  

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```
  - EMEA:  

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```
3. Review the terms of the offer by running one of the following commands:
    - North America:  

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```
    - EMEA:  

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```
  4. Accept the terms of the offering by running one of the following commands:
    - North America:  

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```
    - EMEA:  

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```
  5. Record the image details of your offer and use them to update the **06\_workers.json** Azure Resource Manager (ARM) template.
  6. Update the **storageProfile.imageReference** field by deleting the **id** parameter and adding the **offer**, **publisher**, **sku**, and **version** parameters by using the values from your offer. You can find a sample template in the "Creating additional worker machines in Azure" section.

### 5.10.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.10.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

## 5.10.8. Creating the installation files for Azure

To install OpenShift Container Platform on Microsoft Azure using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

### 5.10.8.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

## Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> 1
      partitions:
        - label: var
          start_mib: <partition_start_offset> 2
          size_mib: <partition_size> 3
  filesystems:
    - device: /dev/disk/by-partlabel/var
      path: /var
```

```
format: xfs
mount_options: [defaults, prjquota] 4
with_mount_unit: true
```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

#### NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 5.10.8.2. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following

- a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.
  - iii. If you do not have a Microsoft Azure profile stored on your computer, specify the following Azure parameter values for your subscription and service principal:
    - **azure subscription id** The subscription ID to use for the cluster. Specify the **id** value in your account output.
    - **azure tenant id** The tenant ID. Specify the **tenantId** value in your account output.
    - **azure service principal client id** The value of the **appId** parameter for the service principal.
    - **azure service principal client secret** The value of the **password** parameter for the service principal.
  - iv. Select the region to deploy the cluster to.
  - v. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
  - vi. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- vii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
- c. Optional: If you do not want the cluster to provision compute machines, empty the compute pool by editing the resulting **install-config.yaml** file to set **replicas** to **0** for the **compute** pool:

```
compute:
- hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 0 1
```

**1** Set to **0**.

2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 5.10.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 5.10.8.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure.

#### NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Export common variables found in the **install-config.yaml** to be used by the provided ARM templates:

```
$ export CLUSTER_NAME=<cluster_name> 1
$ export AZURE_REGION=<azure_region> 2
$ export SSH_KEY=<ssh_key> 3
$ export BASE_DOMAIN=<base_domain> 4
$ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group> 5
```

- 1 The value of the **.metadata.name** attribute from the **install-config.yaml** file.
- 2 The region to deploy the cluster into, for example **centralus**. This is the value of the **.platform.azure.region** attribute from the **install-config.yaml** file.
- 3 The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the **.sshKey** attribute from the **install-config.yaml** file.
- 4 The base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster. This is the value of the **.baseDomain** attribute from the **install-config.yaml** file.
- 5 The resource group where the public DNS zone exists. This is the value of the **.platform.azure.baseDomainResourceGroupName** attribute from the **install-config.yaml** file.

For example:

-

```
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster
```

2. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

### 5.10.8.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

#### IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

#### Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

- Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

- Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

- Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:
  - Open the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** file.
  - Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
  - Save and exit the file.
- Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the **<installation\_directory>/manifests/cluster-dns-02-config.yml** DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: 1
    id: mycluster-100419-private-zone
  publicZone: 2
    id: example.openshift.com
status: {}
```

- Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

- When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:
  - Export the infrastructure ID by using the following command:

```
$ export INFRA_ID=<infra_id> 1
```

- 1 The OpenShift Container Platform cluster has been assigned an identifier (**INFRA\_ID**) in the form of **<cluster\_name>-<random\_string>**. This will be used as the base name

b. Export the resource group by using the following command:

```
$ export RESOURCE_GROUP=<resource_group> 1
```

- 1 All resources created in this Azure deployment exists as part of a [resource group](#). The resource group name is also based on the **INFRA\_ID**, in the form of **<cluster\_name>-<random\_string>-rg**. This is the value of the **.status.platformStatus.azure.resourceGroupName** attribute from the **manifests/cluster-infrastructure-02-config.yml** file.

7. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$. /openshift-install create ignition-configs --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation\_directory>/auth** directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

### 5.10.9. Creating the Azure resource group

You must create a Microsoft Azure [resource group](#) and an identity for that resource group. These are both used during the installation of your OpenShift Container Platform cluster on Azure.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

#### Procedure

1. Create the resource group in a supported Azure region:

```
$ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
```

2. Create an Azure identity for the resource group:

```
$ az identity create -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity
```

This is used to grant the required access to Operators in your cluster. For example, this allows the Ingress Operator to create a public IP and its load balancer. You must assign the Azure identity to a role.

3. Grant the Contributor role to the Azure identity:

- a. Export the following variables required by the Azure role assignment:

```
$ export PRINCIPAL_ID=`az identity show -g ${RESOURCE_GROUP} -n ${INFRA_ID}-identity --query principalId --out tsv`
```

```
$ export RESOURCE_GROUP_ID=`az group show -g ${RESOURCE_GROUP} --query id --out tsv`
```

- b. Assign the Contributor role to the identity:

```
$ az role assignment create --assignee "${PRINCIPAL_ID}" --role 'Contributor' --scope "${RESOURCE_GROUP_ID}"
```

### 5.10.10. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally; therefore, you must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

#### Procedure

1. Create an Azure storage account to store the VHD cluster image:

```
$ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
```

#### WARNING

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your **CLUSTER\_NAME** variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see [Resolve errors for storage account names](#) in the Azure documentation.

- Export the storage account key as an environment variable:

```
$ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --
account-name ${CLUSTER_NAME}sa --query "[0].value" -o tsv`
```

- Choose the RHCOS version to use and export the URL of its VHD to an environment variable:

```
$ export VHD_URL=`curl -s https://raw.githubusercontent.com/openshift/installer/release-
4.9/data/data/rhcos.json | jq -r .azure.url`
```

### IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

- Create the storage container for the VHD:

```
$ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-
key ${ACCOUNT_KEY}
```

- Copy the chosen VHD to a blob:

```
$ az storage blob copy start --account-name ${CLUSTER_NAME}sa --account-key
${ACCOUNT_KEY} --destination-blob "rhcos.vhd" --destination-container vhd --source-uri
"${VHD_URL}"
```

- Create a blob storage container and upload the generated **bootstrap.ign** file:

```
$ az storage container create --name files --account-name ${CLUSTER_NAME}sa --
account-key ${ACCOUNT_KEY} --public-access blob
```

```
$ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key
${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"
```

### 5.10.11. Example for creating DNS zones

DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, [Azure's DNS solution](#) is used, so you will create a new public DNS zone for external (internet) visibility and a private DNS zone for internal cluster resolution.

### NOTE

The public DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the public DNS zone; be sure the installation config you generated earlier reflects that scenario.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

## Procedure

1. Create the new public DNS zone in the resource group exported in the **BASE\_DOMAIN\_RESOURCE\_GROUP** environment variable:

```
$ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n
${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can skip this step if you are using a public DNS zone that already exists.

2. Create the private DNS zone in the same resource group as the rest of this deployment:

```
$ az network private-dns zone create -g ${RESOURCE_GROUP} -n
${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can learn more about [configuring a public DNS zone in Azure](#) by visiting that section.

### 5.10.12. Creating a VNet in Azure

You must create a virtual network (VNet) in Microsoft Azure for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

## Procedure

1. Copy the template from the **ARM template for the VNet** section of this topic and save it as **01\_vnet.json** in your cluster's installation directory. This template describes the VNet that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/01_vnet.json" \
--parameters baseName="${INFRA_ID}" 1
```

- 1 The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Link the VNet template to the private DNS zone:

```
$ az network private-dns link vnet create -g ${RESOURCE_GROUP} -z
${CLUSTER_NAME}.${BASE_DOMAIN} -n ${INFRA_ID}-network-link -v "${INFRA_ID}-vnet"
-e false
```

### 5.10.12.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

#### Example 5.1. 01\_vnet.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "virtualNetworkName" : "[concat(parameters('baseName'), '-vnet')]",
    "addressPrefix" : "10.0.0.0/16",
    "masterSubnetName" : "[concat(parameters('baseName'), '-master-subnet')]",
    "masterSubnetPrefix" : "10.0.0.0/24",
    "nodeSubnetName" : "[concat(parameters('baseName'), '-worker-subnet')]",
    "nodeSubnetPrefix" : "10.0.1.0/24",
    "clusterNsgName" : "[concat(parameters('baseName'), '-nsg')]"
  },
  "resources" : [
    {
      "apiVersion" : "2018-12-01",
      "type" : "Microsoft.Network/virtualNetworks",
      "name" : "[variables('virtualNetworkName')]",
      "location" : "[variables('location')]",
      "dependsOn" : [
        "[concat('Microsoft.Network/networkSecurityGroups/', variables('clusterNsgName'))]"
      ],
      "properties" : {
        "addressSpace" : {
          "addressPrefixes" : [
            "[variables('addressPrefix')]"
          ]
        }
      },
      "subnets" : [
```

```

    {
      "name" : "[variables('masterSubnetName')]",
      "properties" : {
        "addressPrefix" : "[variables('masterSubnetPrefix')]",
        "serviceEndpoints" : [],
        "networkSecurityGroup" : {
          "id" : "[resourceId('Microsoft.Network/networkSecurityGroups',
variables('clusterNsgName'))]"
        }
      }
    },
    {
      "name" : "[variables('nodeSubnetName')]",
      "properties" : {
        "addressPrefix" : "[variables('nodeSubnetPrefix')]",
        "serviceEndpoints" : [],
        "networkSecurityGroup" : {
          "id" : "[resourceId('Microsoft.Network/networkSecurityGroups',
variables('clusterNsgName'))]"
        }
      }
    }
  ]
},
{
  "type" : "Microsoft.Network/networkSecurityGroups",
  "name" : "[variables('clusterNsgName')]",
  "apiVersion" : "2018-10-01",
  "location" : "[variables('location')]",
  "properties" : {
    "securityRules" : [
      {
        "name" : "apiserver_in",
        "properties" : {
          "protocol" : "Tcp",
          "sourcePortRange" : "*",
          "destinationPortRange" : "6443",
          "sourceAddressPrefix" : "*",
          "destinationAddressPrefix" : "*",
          "access" : "Allow",
          "priority" : 101,
          "direction" : "Inbound"
        }
      }
    ]
  }
}
]
}

```

### 5.10.13. Deploying the RHCOS cluster image for the Azure infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure for your OpenShift Container Platform nodes.

### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

### Procedure

1. Copy the template from the **ARM template for image storage** section of this topic and save it as **02\_storage.json** in your cluster's installation directory. This template describes the image storage that your cluster requires.
2. Export the RHCOS VHD blob URL as a variable:

```
$ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
```

3. Deploy the cluster image:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/02_storage.json" \
  --parameters vhdBlobURL="${VHD_BLOB_URL}" \ 1 \
  --parameters baseName="${INFRA_ID}" 2
```

- 1** The blob URL of the RHCOS VHD to be used to create master and worker machines.
- 2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

#### 5.10.13.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

##### Example 5.2. 02\_storage.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    }
  },
}
```

```

    "vhdBlobURL" : {
      "type" : "string",
      "metadata" : {
        "description" : "URL pointing to the blob where the VHD to be used to create master and
worker machines is located"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "imageName" : "[concat(parameters('baseName'), '-image')]"
  },
  "resources" : [
    {
      "apiVersion" : "2018-06-01",
      "type" : "Microsoft.Compute/images",
      "name" : "[variables('imageName')]",
      "location" : "[variables('location')]",
      "properties" : {
        "storageProfile" : {
          "osDisk" : {
            "osType" : "Linux",
            "osState" : "Generalized",
            "blobUri" : "[parameters('vhdBlobURL')]",
            "storageAccountType" : "Standard_LRS"
          }
        }
      }
    }
  ]
}

```

#### 5.10.14. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in **inittamfs** during boot to fetch their Ignition config files.

##### 5.10.14.1. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

#### IMPORTANT

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 5.37. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	<b>1936</b>	Metrics
	<b>9000-9999</b>	Host level services, including the node exporter on ports <b>9100-9101</b> and the Cluster Version Operator on port <b>9099</b> .
	<b>10250-10259</b>	The default ports that Kubernetes reserves
	<b>10256</b>	openshift-sdn
UDP	<b>4789</b>	VXLAN and Geneve
	<b>6081</b>	VXLAN and Geneve
	<b>9000-9999</b>	Host level services, including the node exporter on ports <b>9100-9101</b> .
	<b>500</b>	IPsec IKE packets
	<b>4500</b>	IPsec NAT-T packets
TCP/UDP	<b>30000-32767</b>	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 5.38. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	<b>6443</b>	Kubernetes API

Table 5.39. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	<b>2379-2380</b>	etcd server and peer ports

### 5.10.15. Creating networking and load balancing components in Azure

You must configure networking and load balancing in Microsoft Azure for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

## NOTE

If you do not use the provided ARM template to create your Azure infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.

## Procedure

1. Copy the template from the **ARM template for the network and load balancers** section of this topic and save it as **03\_infra.json** in your cluster's installation directory. This template describes the networking and load balancing objects that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/03_infra.json" \
  --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASE_DOMAIN}" \ 1
  --parameters baseName="${INFRA_ID}" 2
```

- 1** The name of the private DNS zone.
- 2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Create an **api** DNS record in the public zone for the API public load balancer. The **\${BASE\_DOMAIN\_RESOURCE\_GROUP}** variable must point to the resource group where the public DNS zone exists.

- a. Export the following variable:

```
$ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?
name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
```

- b. Create the **api** DNS record in a new public zone:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
```

If you are adding the cluster to an existing public zone, you can create the **api** DNS record in it instead:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
```

### 5.10.15.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

### Example 5.3. 03\_infra.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "privateDNSZoneName" : {
      "type" : "string",
      "metadata" : {
        "description" : "Name of the private DNS zone"
      }
    }
  },
  "variables" : {
    "location" : "[resourceGroup().location]",
    "virtualNetworkName" : "[concat(parameters('baseName'), '-vnet')]",
    "virtualNetworkID" : "[resourceId('Microsoft.Network/virtualNetworks', variables('virtualNetworkName'))]",
    "masterSubnetName" : "[concat(parameters('baseName'), '-master-subnet')]",
    "masterSubnetRef" : "[concat(variables('virtualNetworkID'), '/subnets/', variables('masterSubnetName'))]",
    "masterPublicIpAddressName" : "[concat(parameters('baseName'), '-master-pip')]",
    "masterPublicIpAddressID" : "[resourceId('Microsoft.Network/publicIPAddresses', variables('masterPublicIpAddressName'))]",
    "masterLoadBalancerName" : "[concat(parameters('baseName'), '-public-lb')]",
    "masterLoadBalancerID" : "[resourceId('Microsoft.Network/loadBalancers', variables('masterLoadBalancerName'))]",
    "internalLoadBalancerName" : "[concat(parameters('baseName'), '-internal-lb')]",
    "internalLoadBalancerID" : "[resourceId('Microsoft.Network/loadBalancers', variables('internalLoadBalancerName'))]",
    "skuName" : "Standard"
  },
  "resources" : [
    {
      "apiVersion" : "2018-12-01",
      "type" : "Microsoft.Network/publicIPAddresses",
      "name" : "[variables('masterPublicIpAddressName')]",
      "location" : "[variables('location')]",

}

```

### 5.10.16. Creating the bootstrap machine in Azure

You must create the bootstrap machine in Microsoft Azure to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.

- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.

## Procedure

1. Copy the template from the **ARM template for the bootstrap machine** section of this topic and save it as **04\_bootstrap.json** in your cluster's installation directory. This template describes the bootstrap machine that your cluster requires.

2. Export the bootstrap URL variable:

```
$ export BOOTSTRAP_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -n "bootstrap.ign" -o tsv`
```

3. Export the bootstrap ignition variable:

```
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d '\n`
```

4. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/04_bootstrap.json" \
  --parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \ 1
  --parameters sshKeyData="${SSH_KEY}" \ 2
  --parameters baseName="${INFRA_ID}" 3
```

- 1** The bootstrap Ignition content for the bootstrap cluster.
- 2** The SSH RSA public key file as a string.
- 3** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 5.10.16.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

#### Example 5.4. 04\_bootstrap.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
```

```
"metadata" : {
  "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
},
"bootstrapIgnition" : {
  "type" : "string",
  "minLength" : 1,
  "metadata" : {
    "description" : "Bootstrap ignition content for the bootstrap cluster"
  }
},
"sshKeyData" : {
  "type" : "securestring",
  "metadata" : {
    "description" : "SSH RSA public key file as a string."
  }
},
"bootstrapVMSize" : {
  "type" : "string",
  "defaultValue" : "Standard_D4s_v3",
  "allowedValues" : [
    "Standard_A2",
    "Standard_A3",

### 5.10.17. Creating the control plane machines in Azure

You must create the control plane machines in Microsoft Azure for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.

#### Procedure

1. Copy the template from the **ARM template for control plane machines** section of this topic and save it as **05\_masters.json** in your cluster's installation directory. This template describes the control plane machines that your cluster requires.
2. Export the following variable needed by the control plane machine deployment:

```
$ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d "\n"
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/05_masters.json" \
  --parameters masterIgnition="${MASTER_IGNITION}" \ 1
  --parameters sshKeyData="${SSH_KEY}" \ 2
  --parameters privateDNSZoneName="${CLUSTER_NAME}.${BASE_DOMAIN}" \ 3
  --parameters baseName="${INFRA_ID}" \ 4
```

- 1** The Ignition content for the control plane nodes.
- 2** The SSH RSA public key file as a string.
- 3** The name of the private DNS zone to which the control plane nodes are attached.
- 4** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 5.10.17.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

#### Example 5.5. 05\_masters.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",
  "parameters" : {
    "baseName" : {
      "type" : "string",
      "minLength" : 1,
      "metadata" : {
        "description" : "Base name to be used in resource names (usually the cluster's Infra ID)"
      }
    },
    "masterIgnition" : {
      "type" : "string",
      "metadata" : {

```

### 5.10.18. Wait for bootstrap completion and remove bootstrap resources in Azure

After you create all of the required infrastructure in Microsoft Azure, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

## Procedure

1. Change to the directory that contains the installation program and run the following command:

```

$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level info 2

```

1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```

$ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --
name bootstrap_ssh_in
$ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
$ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap OSDisk --no-
wait --yes
$ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-
wait
$ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name
${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
$ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-
ssh-pip

```

### NOTE

If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

## 5.10.19. Creating additional worker machines in Azure

You can create worker machines in Microsoft Azure for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift

Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM) template. Additional instances can be launched by including additional resources of type **06\_workers.json** in the file.

## NOTE

If you do not use the provided ARM template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure.
- Create and configure networking and load balancers in Azure.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

## Procedure

1. Copy the template from the **ARM template for worker machines** section of this topic and save it as **06\_workers.json** in your cluster's installation directory. This template describes the worker machines that your cluster requires.
2. Export the following variable needed by the worker machine deployment:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d '\n'`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/06_workers.json" \
  --parameters workerIgnition="${WORKER_IGNITION}" \ 1
  --parameters sshKeyData="${SSH_KEY}" \ 2
  --parameters baseName="${INFRA_ID}" \ 3
```

- 1** The Ignition content for the worker nodes.
- 2** The SSH RSA public key file as a string.
- 3** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 5.10.19.1. ARM template for worker machines

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

#### Example 5.6. 06\_workers.json ARM template

```
{
  "$schema" : "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion" : "1.0.0.0",

      },
      "diskSizeGB": 128
    }
  }
}
}

```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 5.10.21. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The

**kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

## 5.10.22. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

### Prerequisites

- You added machines to your cluster.

### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.22.1
master-1  Ready   master 63m  v1.22.1
master-2  Ready   master 64m  v1.22.1
```

The output lists all of the machines that you created.

**NOTE**

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

```
NAME          AGE   REQUESTOR                                     CONDITION
csr-8b2br    15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps    15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n' | xargs --no-run-if-empty oc adm certificate approve
```

#### NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

#### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

1 **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 73m  v1.22.1
master-1  Ready   master 73m  v1.22.1
```

```

master-2 Ready   master 74m v1.22.1
worker-0 Ready   worker 11m v1.22.1
worker-1 Ready   worker 11m v1.22.1

```

## NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 5.10.23. Adding the Ingress DNS records

If you removed the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can create either a wildcard **\*.apps.{baseDomain}**, or specific records. You can use A, CNAME, and other records per your requirements.

### Prerequisites

- You deployed an OpenShift Container Platform cluster on Microsoft Azure by using infrastructure that you provisioned.
- Install the OpenShift CLI (**oc**).
- Install or update the [Azure CLI](#).

### Procedure

1. Confirm the Ingress router has created a load balancer and populated the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

### Example output

```

NAME          TYPE          CLUSTER-IP    EXTERNAL-IP    PORT(S)          AGE
router-default LoadBalancer  172.30.20.10  35.130.120.110 80:32288/TCP,443:31215/TCP 20

```

2. Export the Ingress router IP as a variable:

```
$ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

3. Add a **\*.apps** record to the public DNS zone.

- a. If you are adding this cluster to a new public zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300
```

- b. If you are adding this cluster to an already existing public zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300
```

4. Add a **\*.apps** record to the private DNS zone:

- a. Create a **\*.apps** record by using the following command:

```
$ az network private-dns record-set a create -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps --ttl 300
```

- b. Add the **\*.apps** record to the private DNS zone by using the following command:

```
$ az network private-dns record-set a add-record -g ${RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER}
```

If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the cluster's current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}{end}' routes
```

### Example output

```
oauth-openshift.apps.cluster.basedomain.com
console-openshift-console.apps.cluster.basedomain.com
downloads-openshift-console.apps.cluster.basedomain.com
alertmanager-main-openshift-monitoring.apps.cluster.basedomain.com
grafana-openshift-monitoring.apps.cluster.basedomain.com
prometheus-k8s-openshift-monitoring.apps.cluster.basedomain.com
```

## 5.10.24. Completing an Azure installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Microsoft Azure user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

### Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure infrastructure.
- Install the **oc** CLI and log in.

### Procedure

- Complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

### Example output

INFO Waiting up to 30m0s for the cluster to initialize...

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## 5.10.25. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 5.11. UNINSTALLING A CLUSTER ON AZURE

You can remove a cluster that you deployed to Microsoft Azure.

### 5.11.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

### NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

### Prerequisites

- Have a copy of the installation program that you used to deploy the cluster.
- Have the files that the installation program generated when you created your cluster.

While you can uninstall the cluster using the copy of the installation program that was used to deploy it, using OpenShift Container Platform version 4.13 or later is recommended.

The removal of service principals is dependent on the Microsoft Azure AD Graph API. Using version 4.13 or later of the installation program ensures that service principals are removed without the need for manual intervention, if and when Microsoft decides to [retire](#) the Azure AD Graph API.

## Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
┌ $ ./openshift-install destroy cluster \  
└ --dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

2. Optional: Delete the **<installation\_directory>** directory and the OpenShift Container Platform installation program.

## CHAPTER 6. INSTALLING ON AZURE STACK HUB

### 6.1. PREPARING TO INSTALL ON AZURE STACK HUB

#### 6.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You have installed Azure Stack Hub version 2008 or later.

#### 6.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub

Before installing OpenShift Container Platform on Microsoft Azure Stack Hub, you must configure an Azure account. See [Configuring an Azure Stack Hub account](#) for details about account configuration, account limits, DNS zone configuration, required roles, and creating service principals.

You must manually manage your cloud credentials when installing a cluster to Azure Stack Hub. Do this by configuring the Cloud Credential Operator (CCO) for manual mode before you install the cluster. For more information, see [Manually creating IAM for Azure](#).

#### 6.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub

You can install OpenShift Container Platform on Azure Stack Hub using user-provisioned infrastructure. This means you must manage and maintain the cluster resources yourself. Installing OpenShift Container Platform on Azure Stack Hub using an installation program that automatically provisions the cluster infrastructure is not supported at this time.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 6.1.3.1. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure Stack Hub infrastructure that you provision, by using the following method:

- [Installing a cluster on Azure Stack Hub using ARM templates](#) You can install OpenShift Container Platform on Azure Stack Hub by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

#### 6.1.4. Next steps

- [Configuring an Azure Stack Hub account](#)

### 6.2. CONFIGURING AN AZURE STACK HUB ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account.

## IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 6.2.1. Azure Stack Hub account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure Stack Hub components, and the default [Quota types in Azure Stack Hub](#) affect your ability to install OpenShift Container Platform clusters.

The following table summarizes the Azure Stack Hub components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Description
vCPU	56	<p>A default cluster requires 56 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>● One bootstrap machine, which is removed after installation</li> <li>● Three control plane machines</li> <li>● Three compute machines</li> </ul> <p>Because the bootstrap, control plane, and worker machines use <b>Standard_DS4_v2</b> virtual machines, which use 8 vCPUs, a default cluster requires 56 vCPUs. The bootstrap node VM is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p>
OS Disk	7	<p>VM OS disk must be able to sustain a tested and recommended minimum throughput of 5000 IOPS / 200MBps for control plane machines. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure Stack Hub, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by <b>Standard_D8s_v3</b>, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required.</p> <p>Host caching must be set to <b>ReadOnly</b> for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</p>

Component	Number of components required by default	Description						
VNet	1	Each default cluster requires one Virtual Network (VNet), which contains two subnets.						
Network interfaces	7	Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.						
Network security groups	2	Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets: <table border="1" data-bbox="663 698 1428 943"> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443		
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere							
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443							
Network load balancers	3	Each cluster creates the following <a href="#">load balancers</a> : <table border="1" data-bbox="663 1099 1428 1413"> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines							
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines							
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines							
Public IP addresses	2	The public load balancer uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.						
Private IP addresses	7	The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.						

### 6.2.2. Configuring a DNS zone in Azure Stack Hub

To successfully install OpenShift Container Platform on Azure Stack Hub, you must create DNS records in an Azure Stack Hub DNS zone. The DNS zone must be authoritative for the domain. To delegate a registrar's DNS zone to Azure Stack Hub, see Microsoft's documentation for [Azure Stack Hub](#)

[datacenter DNS integration](#).

### 6.2.3. Required Azure Stack Hub roles

Your Microsoft Azure Stack Hub account must have the following roles for the subscription that you use:

- **Owner**

To set roles on the Azure portal, see the [Manage access to resources in Azure Stack Hub with role-based access control](#) in the Microsoft documentation.

### 6.2.4. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

#### Prerequisites

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

#### Procedure

1. Register your environment:

```
$ az cloud register -n AzureStackCloud --endpoint-resource-manager <endpoint> 1
```

- 1** Specify the Azure Resource Manager endpoint, `https://management.<region>.<fqdn>/`.`

See the [Microsoft documentation](#) for details.

2. Set the active environment:

```
$ az cloud set -n AzureStackCloud
```

3. Update your environment configuration to use the specific API version for Azure Stack Hub:

```
$ az cloud update --profile 2019-03-01-hybrid
```

4. Log in to the Azure CLI:

```
$ az login
```

If you are in a multitenant environment, you must also supply the tenant ID.

5. If your Azure account uses subscriptions, ensure that you are using the right subscription:

- a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

### Example output

```
[
  {
    "cloudName": AzureStackCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

### Example output

```
{
  "environmentName": AzureStackCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", 1
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

- 1** Ensure that the value of the **tenantId** parameter is the correct subscription ID.

- c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> 1
```

- 1** Specify the subscription ID.

- d. Verify the subscription ID update:

```
$ az account show
```

### Example output

```
{
  "environmentName": AzureStackCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

- Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.
- Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ 1
--scopes /subscriptions/<subscription_id> 2
--years <years> 3
```

- Specify the service principal name.
- Specify the subscription ID.
- Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

### Example output

```
Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not
include these credentials in your code or check the credentials into your source
control. For more information, see https://aka.ms/azadsp-cli
{
  "appId": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}
```

- Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.

### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

### 6.2.5. Next steps

- Configure your Azure Stack Hub credentials by following [Manually creating IAM for Azure Stack Hub](#).

- Install an OpenShift Container Platform cluster on Azure Stack Hub with user-provisioned infrastructure by following [Installing a cluster on Azure Stack Hub using ARM templates](#) .

## 6.3. MANUALLY CREATING IAM FOR AZURE STACK HUB

In environments where the cloud identity and access management (IAM) APIs are not reachable, you must put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

### 6.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

#### Additional resources

- For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

### 6.3.2. Manually create IAM

The Cloud Credential Operator (CCO) only supports your cloud provider in manual mode. As a result, you must specify the identity and access management (IAM) secrets for your cloud provider.

#### Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

#### Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

- From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

- Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
  --credentials-requests \
  --cloud=azure
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
    ...
```

- Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample CredentialsRequest object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
```

```

apiVersion: cloudcredential.openshift.io/v1
kind: AzureProviderSpec
roleBindings:
- role: Contributor
...
secretRef:
name: <component-secret>
namespace: <component-namespace>
...

```

### Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
name: <component-secret>
namespace: <component-namespace>
data:
azure_subscription_id: <base64_encoded_azure_subscription_id>
azure_client_id: <base64_encoded_azure_client_id>
azure_client_secret: <base64_encoded_azure_client_secret>
azure_tenant_id: <base64_encoded_azure_tenant_id>
azure_resource_prefix: <base64_encoded_azure_resource_prefix>
azure_resourcegroup: <base64_encoded_azure_resourcegroup>
azure_region: <base64_encoded_azure_region>

```

### IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

### 6.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.8 to 4.9, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.
- For z-stream releases, for example, from 4.9.0 to 4.9.1, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

#### Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release.

The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.

2. Update the manually maintained credentials on your cluster:
  - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
  - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.
3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:
  - a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.
  - b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

#### Text to add

```
...
metadata:
  annotations:
    cloudcredential.openshift.io/upgradeable-to: <version_number>
...
```

Where **<version\_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
  - a. In the **Administrator** perspective of the web console, navigate to **Administration** → **Cluster Settings**.
  - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
  - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

### 6.3.4. Next steps

- Install an OpenShift Container Platform cluster on Azure Stack Hub with user-provisioned infrastructure by following [Installing a cluster on Azure Stack Hub using ARM templates](#) .

## 6.4. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES

In OpenShift Container Platform version 4.9, you can install a cluster on Microsoft Azure Stack Hub by using infrastructure that you provide.

Several [Azure Resource Manager \(ARM\)](#) templates are provided to assist in completing these steps or to help model your own.

### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several ARM templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

## 6.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure Stack Hub account](#) to host the cluster.
- You downloaded the Azure CLI and installed it on your computer. See [Install the Azure CLI](#) in the Azure documentation. The documentation below was tested using version **2.28.0** of the Azure CLI. Azure CLI commands might perform differently based on the version you use.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

### NOTE

Be sure to also review this site list if you are configuring a proxy.

## 6.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

## IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 6.4.3. Configuring your Azure Stack Hub project

Before you can install OpenShift Container Platform, you must configure an Azure project to host it.

## IMPORTANT

All Azure Stack Hub resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure Stack Hub restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

#### 6.4.3.1. Azure Stack Hub account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure Stack Hub components, and the default [Quota types in Azure Stack Hub](#) affect your ability to install OpenShift Container Platform clusters.

The following table summarizes the Azure Stack Hub components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of components required by default	Description
vCPU	56	<p>A default cluster requires 56 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>● One bootstrap machine, which is removed after installation</li> <li>● Three control plane machines</li> <li>● Three compute machines</li> </ul> <p>Because the bootstrap, control plane, and worker machines use <b>Standard_DS4_v2</b> virtual machines, which use 8 vCPUs, a default cluster requires 56 vCPUs. The bootstrap node VM is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p>

Component	Number of components required by default	Description						
OS Disk	7	<p>VM OS disk must be able to sustain a tested and recommended minimum throughput of 5000 IOPS / 200MBps for control plane machines. This throughput can be provided by having a minimum of 1 TiB Premium SSD (P30). In Azure Stack Hub, disk performance is directly dependent on SSD disk sizes, so to achieve the throughput supported by <b>Standard_D8s_v3</b>, or other similar machine types available, and the target of 5000 IOPS, at least a P30 disk is required.</p> <p>Host caching must be set to <b>ReadOnly</b> for low read latency and high read IOPS and throughput. The reads performed from the cache, which is present either in the VM memory or in the local SSD disk, are much faster than the reads from the data disk, which is in the blob storage.</p>						
VNet	1	Each default cluster requires one Virtual Network (VNet), which contains two subnets.						
Network interfaces	7	Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.						
Network security groups	2	<p>Each cluster creates network security groups for each subnet in the VNet. The default cluster creates network security groups for the control plane and for the compute node subnets:</p> <table border="1"> <tbody> <tr> <td><b>control plane</b></td> <td>Allows the control plane machines to be reached on port 6443 from anywhere</td> </tr> <tr> <td><b>node</b></td> <td>Allows worker nodes to be reached from the internet on ports 80 and 443</td> </tr> </tbody> </table>	<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere	<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443		
<b>control plane</b>	Allows the control plane machines to be reached on port 6443 from anywhere							
<b>node</b>	Allows worker nodes to be reached from the internet on ports 80 and 443							
Network load balancers	3	<p>Each cluster creates the following <a href="#">load balancers</a>:</p> <table border="1"> <tbody> <tr> <td><b>default</b></td> <td>Public IP address that load balances requests to ports 80 and 443 across worker machines</td> </tr> <tr> <td><b>internal</b></td> <td>Private IP address that load balances requests to ports 6443 and 22623 across control plane machines</td> </tr> <tr> <td><b>external</b></td> <td>Public IP address that load balances requests to port 6443 across control plane machines</td> </tr> </tbody> </table> <p>If your applications create more Kubernetes <b>LoadBalancer</b> service objects, your cluster uses more load balancers.</p>	<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines	<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines	<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines
<b>default</b>	Public IP address that load balances requests to ports 80 and 443 across worker machines							
<b>internal</b>	Private IP address that load balances requests to ports 6443 and 22623 across control plane machines							
<b>external</b>	Public IP address that load balances requests to port 6443 across control plane machines							

Component	Number of components required by default	Description
Public IP addresses	2	The public load balancer uses a public IP address. The bootstrap machine also uses a public IP address so that you can SSH into the machine to troubleshoot issues during installation. The IP address for the bootstrap node is used only during installation.
Private IP addresses	7	The internal load balancer, each of the three control plane machines, and each of the three worker machines each use a private IP address.

### 6.4.3.2. Configuring a DNS zone in Azure Stack Hub

To successfully install OpenShift Container Platform on Azure Stack Hub, you must create DNS records in an Azure Stack Hub DNS zone. The DNS zone must be authoritative for the domain. To delegate a registrar's DNS zone to Azure Stack Hub, see Microsoft's documentation for [Azure Stack Hub datacenter DNS integration](#).

You can view Azure's DNS solution by visiting this [example for creating DNS zones](#).

### 6.4.3.3. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

### 6.4.3.4. Required Azure Stack Hub roles

Your Microsoft Azure Stack Hub account must have the following roles for the subscription that you use:

- **Owner**

To set roles on the Azure portal, see the [Manage access to resources in Azure Stack Hub with role-based access control](#) in the Microsoft documentation.

### 6.4.3.5. Creating a service principal

Because OpenShift Container Platform and its installation program create Microsoft Azure resources by using the Azure Resource Manager, you must create a service principal to represent it.

#### Prerequisites

- Install or update the [Azure CLI](#).
- Your Azure account has the required roles for the subscription that you use.

#### Procedure

1. Register your environment:

```
$ az cloud register -n AzureStackCloud --endpoint-resource-manager <endpoint> 1
```

- 1 Specify the Azure Resource Manager endpoint, ``https://management.<region>.<fqdn>/``.

See the [Microsoft documentation](#) for details.

2. Set the active environment:

```
$ az cloud set -n AzureStackCloud
```

3. Update your environment configuration to use the specific API version for Azure Stack Hub:

```
$ az cloud update --profile 2019-03-01-hybrid
```

4. Log in to the Azure CLI:

```
$ az login
```

If you are in a multitenant environment, you must also supply the tenant ID.

5. If your Azure account uses subscriptions, ensure that you are using the right subscription:

- a. View the list of available accounts and record the **tenantId** value for the subscription you want to use for your cluster:

```
$ az account list --refresh
```

#### Example output

```
[
  {
    "cloudName": "AzureStackCloud",
    "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
    "isDefault": true,
    "name": "Subscription Name",
    "state": "Enabled",
    "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee",
    "user": {
      "name": "you@example.com",
      "type": "user"
    }
  }
]
```

- b. View your active account details and confirm that the **tenantId** value matches the subscription you want to use:

```
$ az account show
```

#### Example output

```
-
```

```
{
  "environmentName": "AzureStackCloud",
  "id": "9bab1460-96d5-40b3-a78e-17b15e978a80",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "6057c7e9-b3ae-489d-a54e-de3f6bf6a8ee", ❶
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

❶ Ensure that the value of the **tenantId** parameter is the correct subscription ID.

c. If you are not using the right subscription, change the active subscription:

```
$ az account set -s <subscription_id> ❶
```

❶ Specify the subscription ID.

d. Verify the subscription ID update:

```
$ az account show
```

### Example output

```
{
  "environmentName": "AzureStackCloud",
  "id": "33212d16-bdf6-45cb-b038-f6565b61edda",
  "isDefault": true,
  "name": "Subscription Name",
  "state": "Enabled",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee",
  "user": {
    "name": "you@example.com",
    "type": "user"
  }
}
```

6. Record the **tenantId** and **id** parameter values from the output. You need these values during the OpenShift Container Platform installation.

7. Create the service principal for your account:

```
$ az ad sp create-for-rbac --role Contributor --name <service_principal> \ ❶
--scopes /subscriptions/<subscription_id> ❷
--years <years> ❸
```

❶ Specify the service principal name.

❷ Specify the subscription ID.

- 3** Specify the number of years. By default, a service principal expires in one year. By using the **--years** option you can extend the validity of your service principal.

### Example output

Creating 'Contributor' role assignment under scope '/subscriptions/<subscription\_id>  
The output includes credentials that you must protect. Be sure that you do not include these credentials in your code or check the credentials into your source control. For more information, see <https://aka.ms/azadsp-cli>

```
{
  "appId": "ac461d78-bf4b-4387-ad16-7e32e328aec6",
  "displayName": <service_principal>,
  "password": "00000000-0000-0000-0000-000000000000",
  "tenantId": "8049c7e9-c3de-762d-a54e-dc3f6be6a7ee"
}
```

8. Record the values of the **appId** and **password** parameters from the previous output. You need these values during OpenShift Container Platform installation.

### Additional resources

- For more information about CCO modes, see [About the Cloud Credential Operator](#).

## 6.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

- Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
- Select **Azure** as the cloud provider if you are installing your cluster on Azure Stack Hub.
- Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

#### 6.4.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> ❶
```

- ❶ Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 6.4.6. Creating the installation files for Azure Stack Hub

To install OpenShift Container Platform on Microsoft Azure Stack Hub using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You manually create the **install-config.yaml** file, and then generate and customize the Kubernetes manifests and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

### 6.4.6.1. Manually creating the installation configuration file

#### Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

#### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

#### NOTE

You must name this configuration file **install-config.yaml**.

Make the following modifications for Azure Stack Hub:

- a. Set the **replicas** parameter to **0** for the **compute** pool:

```
compute:
- hyperthreading: Enabled
  name: worker
```

```
platform: {}
replicas: 0 1
```

- 1** Set to **0**.

The compute machines will be provisioned manually later.

- b. Update the **platform.azure** section of the **install-config.yaml** file to configure your Azure Stack Hub configuration:

```
platform:
  azure:
    armEndpoint: <azurestack_arm_endpoint> 1
    baseDomainResourceGroupName: <resource_group> 2
    cloudName: AzureStackCloud 3
    region: <azurestack_region> 4
```

- 1** Specify the Azure Resource Manager endpoint of your Azure Stack Hub environment, like **https://management.local.azurestack.external**.
- 2** Specify the name of the resource group that contains the DNS zone for your base domain.
- 3** Specify the Azure Stack Hub environment, which is used to configure the Azure SDK with the appropriate Azure API endpoints.
- 4** Specify the name of your Azure Stack Hub region.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

#### 6.4.6.2. Sample customized install-config.yaml file for Azure Stack Hub

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

### IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```
apiVersion: v1
baseDomain: example.com
controlPlane: 1
  name: master
  replicas: 3
compute: 2
  - name: worker
```

```

platform: {}
replicas: 0
metadata:
  name: test-cluster 3
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  azure:
    armEndpoint: azurestack_arm_endpoint 4
    baseDomainResourceGroupName: resource_group 5
    region: azure_stack_local_region 6
    resourceGroupName: existing_resource_group 7
    outboundType: Loadbalancer
    cloudName: AzureStackCloud 8
pullSecret: '{"auths": ...}' 9
fips: false 10
additionalTrustBundle: | 11
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
sshKey: ssh-ed25519 AAAA... 12

```

- 1 2 The **controlPlane** section is a single mapping, but the compute section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 3 Specify the name of the cluster.
- 4 Specify the Azure Resource Manager endpoint that your Azure Stack Hub operator provides.
- 5 Specify the name of the resource group that contains the DNS zone for your base domain.
- 6 Specify the name of your Azure Stack Hub local region.
- 7 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 8 Specify the Azure Stack Hub environment as your target platform.
- 9 Specify the pull secret required to authenticate your cluster.
- 10 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 11 If your Azure Stack Hub environment uses an internal certificate authority (CA), add the necessary certificate bundle in **.pem** format.
- 12 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

**6.4.6.3. Configuring the cluster-wide proxy during installation**

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

**Prerequisites**

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

**Procedure**

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
```

```
additionalTrustBundle: | 4
-----BEGIN CERTIFICATE-----
<MY_TRUSTED_CA_CERT>
-----END CERTIFICATE-----
...

```

- 1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2** A proxy URL to use for creating HTTPS connections outside the cluster.
- 3** A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4** If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 6.4.6.4. Exporting common variables for ARM templates

You must export a common set of variables that are used with the provided Azure Resource Manager (ARM) templates used to assist in completing a user-provided infrastructure install on Microsoft Azure Stack Hub.

#### NOTE

Specific ARM templates can also require additional exported variables, which are detailed in their related procedures.

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Export common variables found in the **install-config.yaml** to be used by the provided ARM templates:

```
$ export CLUSTER_NAME=<cluster_name> 1
$ export AZURE_REGION=<azure_region> 2
$ export SSH_KEY=<ssh_key> 3
$ export BASE_DOMAIN=<base_domain> 4
$ export BASE_DOMAIN_RESOURCE_GROUP=<base_domain_resource_group> 5
```

- 1 The value of the **.metadata.name** attribute from the **install-config.yaml** file.
- 2 The region to deploy the cluster into. This is the value of the **.platform.azure.region** attribute from the **install-config.yaml** file.
- 3 The SSH RSA public key file as a string. You must enclose the SSH key in quotes since it contains spaces. This is the value of the **.sshKey** attribute from the **install-config.yaml** file.
- 4 The base domain to deploy the cluster to. The base domain corresponds to the DNS zone that you created for your cluster. This is the value of the **.baseDomain** attribute from the **install-config.yaml** file.
- 5 The resource group where the DNS zone exists. This is the value of the **.platform.azure.baseDomainResourceGroupName** attribute from the **install-config.yaml** file.

For example:

```
$ export CLUSTER_NAME=test-cluster
$ export AZURE_REGION=centralus
$ export SSH_KEY="ssh-rsa xxx/xxx/xxx= user@email.com"
$ export BASE_DOMAIN=example.com
$ export BASE_DOMAIN_RESOURCE_GROUP=ocp-cluster
```

2. Export the kubeadmin credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

### 6.4.6.5. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

## IMPORTANT

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

## Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the worker machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:

- a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
  - b. Locate the `mastersSchedulable` parameter and ensure that it is set to `false`.
  - c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the `privateZone` and `publicZone` sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: ❶
    id: mycluster-100419-private-zone
  publicZone: ❷
    id: example.openshift.com
status: {}
```

- ❶ ❷ Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. Optional: If your Azure Stack Hub environment uses an internal certificate authority (CA), you must update the `.spec.trustedCA.name` field in the `<installation_directory>/manifests/cluster-proxy-01-config.yaml` file to use `user-ca-bundle`:

```
...
spec:
  trustedCA:
    name: user-ca-bundle
...
```

Later, you must update your bootstrap ignition to include the CA.

7. When configuring Azure on user-provisioned infrastructure, you must export some common variables defined in the manifest files to use later in the Azure Resource Manager (ARM) templates:

- a. Export the infrastructure ID by using the following command:

```
$ export INFRA_ID=<infra_id> ❶
```

- ❶ The OpenShift Container Platform cluster has been assigned an identifier (`INFRA_ID`) in the form of `<cluster_name>-<random_string>`. This will be used as the base name for most resources created using the provided ARM templates. This is the value of the `.status.infrastructureName` attribute from the `manifests/cluster-infrastructure-02-config.yml` file.

- b. Export the resource group by using the following command:

```
$ export RESOURCE_GROUP=<resource_group> 1
```

- 1 All resources created in this Azure deployment exists as part of a [resource group](#). The resource group name is also based on the **INFRA\_ID**, in the form of **<cluster\_name>-<random\_string>-rg**. This is the value of the **.status.platformStatus.azure.resourceGroupName** attribute from the **manifests/cluster-infrastructure-02-config.yml** file.

## 8. Manually create your cloud credentials.

- a. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use:

```
$ openshift-install version
```

### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

- b. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 --
credentials-requests --cloud=azure
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  labels:
    controller-tools.k8s.io: "1.0"
  name: openshift-image-registry-azure
  namespace: openshift-cloud-credential-operator
spec:
  secretRef:
    name: installer-cloud-credentials
    namespace: openshift-image-registry
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AzureProviderSpec
    roleBindings:
      - role: Contributor
```

- c. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object. The format for the secret data varies for each cloud provider.
- d. Create a **cco-configmap.yaml** file in the manifests directory with the Cloud Config Operator (CCO) disabled:

### Sample ConfigMap object

```

apiVersion: v1
kind: ConfigMap
metadata:
  name: cloud-credential-operator-config
  namespace: openshift-cloud-credential-operator
  annotations:
    release.openshift.io/create-only: "true"
data:
  disabled: "true"

```

- To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> 1
```

- For **<installation\_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation\_directory>/auth** directory:

```

.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign

```

#### 6.4.6.6. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

## IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

## Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.9.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
```

```

name: 98-var-partition
storage:
  disks:
    - device: /dev/<device_name> ❶
      partitions:
        - label: var
          start_mib: <partition_start_offset> ❷
          size_mib: <partition_size> ❸
      filesystems:
        - device: /dev/disk/by-partlabel/var
          path: /var
          format: xfs
          mount_options: [defaults, prjquota] ❹
          with_mount_unit: true

```

- ❶ The storage device name of the disk that you want to partition.
- ❷ When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- ❸ The size of the data partition in mebibytes.
- ❹ The **prjquota** mount option must be enabled for filesystems used for container storage.

#### NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

### 6.4.7. Creating the Azure resource group

You must create a Microsoft Azure [resource group](#). This is used during the installation of your OpenShift Container Platform cluster on Azure Stack Hub.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

## Procedure

- Create the resource group in a supported Azure region:

```
$ az group create --name ${RESOURCE_GROUP} --location ${AZURE_REGION}
```

### 6.4.8. Uploading the RHCOS cluster image and bootstrap Ignition config file

The Azure client does not support deployments based on files existing locally; therefore, you must copy and store the RHCOS virtual hard disk (VHD) cluster image and bootstrap Ignition config file in a storage container so they are accessible during deployment.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

## Procedure

1. Create an Azure storage account to store the VHD cluster image:

```
$ az storage account create -g ${RESOURCE_GROUP} --location ${AZURE_REGION} --name ${CLUSTER_NAME}sa --kind Storage --sku Standard_LRS
```

#### WARNING

The Azure storage account name must be between 3 and 24 characters in length and use numbers and lower-case letters only. If your **CLUSTER\_NAME** variable does not follow these restrictions, you must manually define the Azure storage account name. For more information on Azure storage account name restrictions, see [Resolve errors for storage account names](#) in the Azure documentation.

2. Export the storage account key as an environment variable:

```
$ export ACCOUNT_KEY=`az storage account keys list -g ${RESOURCE_GROUP} --account-name ${CLUSTER_NAME}sa --query "[0].value" -o tsv`
```

3. Choose the RHCOS version to use and export the URL of its VHD to an environment variable:

```
$ export COMPRESSED_VHD_URL=`curl -s
https://raw.githubusercontent.com/openshift/installer/release-4.9/data/data/rhcos-amd64.json
| jq -r '(.baseURI + .images.azurestack.path)`
```

### IMPORTANT

The RHCOS images might not change with every release of OpenShift Container Platform. You must specify an image with the highest version that is less than or equal to the OpenShift Container Platform version that you install. Use the image version that matches your OpenShift Container Platform version if it is available.

4. Create the storage container for the VHD:

```
$ az storage container create --name vhd --account-name ${CLUSTER_NAME}sa --account-
key ${ACCOUNT_KEY}
```

5. Download the compressed RHCOS VHD file locally:

```
$ curl -O -L ${COMPRESSED_VHD_URL}
```

6. Decompress the VHD file.

### NOTE

The decompressed VHD file is approximately 16 GB, so be sure that your host system has 16 GB of free space available. The VHD file can be deleted once you have uploaded it.

7. Copy the chosen VHD to a blob:

```
$ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key
${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -f rhcos-<rhcos_version>-azurestack.x86_64.vhd
```

8. Create a blob storage container and upload the generated **bootstrap.ign** file:

```
$ az storage container create --name files --account-name ${CLUSTER_NAME}sa --
account-key ${ACCOUNT_KEY} --public-access blob
```

```
$ az storage blob upload --account-name ${CLUSTER_NAME}sa --account-key
${ACCOUNT_KEY} -c "files" -f "<installation_directory>/bootstrap.ign" -n "bootstrap.ign"
```

## 6.4.9. Example for creating DNS zones

DNS records are required for clusters that use user-provisioned infrastructure. You should choose the DNS strategy that fits your scenario.

For this example, [Azure Stack Hub's datacenter DNS integration](#) is used, so you will create a DNS zone.

**NOTE**

The DNS zone is not required to exist in the same resource group as the cluster deployment and might already exist in your organization for the desired base domain. If that is the case, you can skip creating the DNS zone; be sure the installation config you generated earlier reflects that scenario.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

- Create the new DNS zone in the resource group exported in the **BASE\_DOMAIN\_RESOURCE\_GROUP** environment variable:

```
$ az network dns zone create -g ${BASE_DOMAIN_RESOURCE_GROUP} -n
${CLUSTER_NAME}.${BASE_DOMAIN}
```

You can skip this step if you are using a DNS zone that already exists.

You can learn more about [configuring a DNS zone in Azure Stack Hub](#) by visiting that section.

**6.4.10. Creating a VNet in Azure Stack Hub**

You must create a virtual network (VNet) in Microsoft Azure Stack Hub for your OpenShift Container Platform cluster to use. You can customize the VNet to meet your requirements. One way to create the VNet is to modify the provided Azure Resource Manager (ARM) template.

**NOTE**

If you do not use the provided ARM template to create your Azure Stack Hub infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

**Procedure**

1. Copy the template from the **ARM template for the VNet** section of this topic and save it as **01\_vnet.json** in your cluster's installation directory. This template describes the VNet that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/01_vnet.json" \
  --parameters baseName="${INFRA_ID}" 1
```

- 1** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

#### 6.4.10.1. ARM template for the VNet

You can use the following Azure Resource Manager (ARM) template to deploy the VNet that you need for your OpenShift Container Platform cluster:

##### Example 6.1. 01\_vnet.json ARM template

link:[https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/01\\_vnet.json](https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/01_vnet.json)

#### 6.4.11. Deploying the RHCOS cluster image for the Azure Stack Hub infrastructure

You must use a valid Red Hat Enterprise Linux CoreOS (RHCOS) image for Microsoft Azure Stack Hub for your OpenShift Container Platform nodes.

##### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Store the RHCOS virtual hard disk (VHD) cluster image in an Azure storage container.
- Store the bootstrap Ignition config file in an Azure storage container.

##### Procedure

1. Copy the template from the **ARM template for image storage** section of this topic and save it as **02\_storage.json** in your cluster's installation directory. This template describes the image storage that your cluster requires.
2. Export the RHCOS VHD blob URL as a variable:

```
$ export VHD_BLOB_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --
  account-key ${ACCOUNT_KEY} -c vhd -n "rhcos.vhd" -o tsv`
```

3. Deploy the cluster image:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/02_storage.json" \
  --parameters vhdBlobURL="${VHD_BLOB_URL}" 1 \
  --parameters baseName="${INFRA_ID}" 2
```

- 1** The blob URL of the RHCOS VHD to be used to create master and worker machines.

- 2** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

### 6.4.11.1. ARM template for image storage

You can use the following Azure Resource Manager (ARM) template to deploy the stored Red Hat Enterprise Linux CoreOS (RHCOS) image that you need for your OpenShift Container Platform cluster:

#### Example 6.2. 02\_storage.json ARM template

link:[https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/02\\_storage.json](https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/02_storage.json)

### 6.4.12. Networking requirements for user-provisioned infrastructure

All the Red Hat Enterprise Linux CoreOS (RHCOS) machines require networking to be configured in **initramfs** during boot to fetch their Ignition config files.

#### 6.4.12.1. Network connectivity requirements

You must configure the network connectivity between machines to allow OpenShift Container Platform cluster components to communicate. Each machine must be able to resolve the hostnames of all other machines in the cluster.

This section provides details about the ports that are required.

#### IMPORTANT

In connected OpenShift Container Platform environments, all nodes are required to have internet access to pull images for platform containers and provide telemetry data to Red Hat.

Table 6.1. Ports used for all-machine to all-machine communications

Protocol	Port	Description
ICMP	N/A	Network reachability tests
TCP	<b>1936</b>	Metrics
	<b>9000-9999</b>	Host level services, including the node exporter on ports <b>9100-9101</b> and the Cluster Version Operator on port <b>9099</b> .
	<b>10250-10259</b>	The default ports that Kubernetes reserves
	<b>10256</b>	openshift-sdn
UDP	<b>4789</b>	VXLAN and Geneve
	<b>6081</b>	VXLAN and Geneve

Protocol	Port	Description
	<b>9000-9999</b>	Host level services, including the node exporter on ports <b>9100-9101</b> .
	<b>500</b>	IPsec IKE packets
	<b>4500</b>	IPsec NAT-T packets
TCP/UDP	<b>30000-32767</b>	Kubernetes node port
ESP	N/A	IPsec Encapsulating Security Payload (ESP)

Table 6.2. Ports used for all-machine to control plane communications

Protocol	Port	Description
TCP	<b>6443</b>	Kubernetes API

Table 6.3. Ports used for control plane machine to control plane machine communications

Protocol	Port	Description
TCP	<b>2379-2380</b>	etcd server and peer ports

### 6.4.13. Creating networking and load balancing components in Azure Stack Hub

You must configure networking and load balancing in Microsoft Azure Stack Hub for your OpenShift Container Platform cluster to use. One way to create these components is to modify the provided Azure Resource Manager (ARM) template.

Load balancing requires the following DNS records:

- An **api** DNS record for the API public load balancer in the DNS zone.
- An **api-int** DNS record for the API internal load balancer in the DNS zone.

#### NOTE

If you do not use the provided ARM template to create your Azure Stack Hub infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.

- Create and configure a VNet and associated subnets in Azure Stack Hub.

## Procedure

1. Copy the template from the **ARM template for the network and load balancers** section of this topic and save it as **03\_infra.json** in your cluster's installation directory. This template describes the networking and load balancing objects that your cluster requires.
2. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/03_infra.json" \
  --parameters baseName="${INFRA_ID}" 1
```

- 1** The base name to be used in resource names; this is usually the cluster's infrastructure ID.

3. Create an **api** DNS record and an **api-int** DNS record. When creating the API DNS records, the **\${BASE\_DOMAIN\_RESOURCE\_GROUP}** variable must point to the resource group where the DNS zone exists.

- a. Export the following variable:

```
$ export PUBLIC_IP=`az network public-ip list -g ${RESOURCE_GROUP} --query "[?
name=='${INFRA_ID}-master-pip'] | [0].ipAddress" -o tsv`
```

- b. Export the following variable:

```
$ export PRIVATE_IP=`az network lb frontend-ip show -g "$RESOURCE_GROUP" --lb-
name "${INFRA_ID}-internal" -n internal-lb-ip --query "privatelbAddress" -o tsv`
```

- c. Create the **api** DNS record in a new DNS zone:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${CLUSTER_NAME}.${BASE_DOMAIN} -n api -a ${PUBLIC_IP} --ttl 60
```

If you are adding the cluster to an existing DNS zone, you can create the **api** DNS record in it instead:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${BASE_DOMAIN} -n api.${CLUSTER_NAME} -a ${PUBLIC_IP} --ttl 60
```

- d. Create the **api-int** DNS record in a new DNS zone:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z "${CLUSTER_NAME}.${BASE_DOMAIN}" -n api-int -a ${PRIVATE_IP} --ttl 60
```

If you are adding the cluster to an existing DNS zone, you can create the **api-int** DNS record in it instead:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${BASE_DOMAIN} -n api-int.${CLUSTER_NAME} -a ${PRIVATE_IP} --ttl 60
```

### 6.4.13.1. ARM template for the network and load balancers

You can use the following Azure Resource Manager (ARM) template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster:

#### Example 6.3. 03\_infra.json ARM template

link:[https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/03\\_infra.json](https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/03_infra.json)

### 6.4.14. Creating the bootstrap machine in Azure Stack Hub

You must create the bootstrap machine in Microsoft Azure Stack Hub to use during OpenShift Container Platform cluster initialization. One way to create this machine is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your bootstrap machine, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.

#### Procedure

1. Copy the template from the **ARM template for the bootstrap machines** section of this topic and save it as **04\_bootstrap.json** in your cluster's installation directory. This template describes the bootstrap machine that your cluster requires.

2. Export the bootstrap URL variable:

```
$ export BOOTSTRAP_URL=`az storage blob url --account-name ${CLUSTER_NAME}sa --account-key ${ACCOUNT_KEY} -c "files" -n "bootstrap.ign" -o tsv`
```

3. Export the bootstrap ignition variable:

- a. If your environment uses a public certificate authority (CA), run this command:

```
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url ${BOOTSTRAP_URL} '{ignition:{version:$v,config:{replace:{source:$url}}}}' | base64 | tr -d '\n'`
```

- b. If your environment uses an internal CA, you must add your PEM encoded bundle to the bootstrap ignition stub so that your bootstrap virtual machine can pull the bootstrap ignition from the storage account. Run the following commands, which assume your CA is in a file called **CA.pem**:

```
$ export CA="data:text/plain;charset=utf-8;base64,$(cat CA.pem |base64 |tr -d '\n')"
```

```
$ export BOOTSTRAP_IGNITION=`jq -rcnM --arg v "3.2.0" --arg url
"$BOOTSTRAP_URL" --arg cert "$CA" '{ignition:{version:$v,security:{tls:
{certificateAuthorities:[{source:$cert}]}}},config:{replace:{source:$url}}}' | base64 | tr -d
'\n'`
```

4. Create the deployment by using the **az** CLI:

```
$ az deployment group create --verbose -g ${RESOURCE_GROUP} \
--template-file "<installation_directory>/04_bootstrap.json" \
--parameters bootstrapIgnition="${BOOTSTRAP_IGNITION}" \ 1
--parameters sshKeyData="${SSH_KEY}" \ 2
--parameters baseName="${INFRA_ID}" \ 3
--parameters diagnosticsStorageAccountName="${CLUSTER_NAME}sa" 4
```

- 1** The bootstrap Ignition content for the bootstrap cluster.
- 2** The SSH RSA public key file as a string.
- 3** The base name to be used in resource names; this is usually the cluster's infrastructure ID.
- 4** The name of the storage account for your cluster.

#### 6.4.14.1. ARM template for the bootstrap machine

You can use the following Azure Resource Manager (ARM) template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster:

##### Example 6.4. 04\_bootstrap.json ARM template

link:[https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/04\\_bootstrap.json](https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/04_bootstrap.json)

#### 6.4.15. Creating the control plane machines in Azure Stack Hub

You must create the control plane machines in Microsoft Azure Stack Hub for your cluster to use. One way to create these machines is to modify the provided Azure Resource Manager (ARM) template.

#### NOTE

If you do not use the provided ARM template to create your control plane machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.
- Create the bootstrap machine.

## Procedure

1. Copy the template from the **ARM template for control plane machines** section of this topic and save it as **05\_masters.json** in your cluster's installation directory. This template describes the control plane machines that your cluster requires.
2. Export the following variable needed by the control plane machine deployment:

```
$ export MASTER_IGNITION=`cat <installation_directory>/master.ign | base64 | tr -d '\n`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/05_masters.json" \
  --parameters masterIgnition="${MASTER_IGNITION}" ① \
  --parameters sshKeyData="${SSH_KEY}" ② \
  --parameters baseName="${INFRA_ID}" ③ \
  --parameters diagnosticsStorageAccountName="${CLUSTER_NAME}sa" ④
```

- ① The Ignition content for the control plane nodes (also known as the master nodes).
- ② The SSH RSA public key file as a string.
- ③ The base name to be used in resource names; this is usually the cluster's infrastructure ID.
- ④ The name of the storage account for your cluster.

### 6.4.15.1. ARM template for control plane machines

You can use the following Azure Resource Manager (ARM) template to deploy the control plane machines that you need for your OpenShift Container Platform cluster:

#### Example 6.5. 05\_masters.json ARM template

```
link:https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/05_masters.json[]
```

## 6.4.16. Wait for bootstrap completion and remove bootstrap resources in Azure Stack Hub

After you create all of the required infrastructure in Microsoft Azure Stack Hub, wait for the bootstrap process to complete on the machines that you provisioned by using the Ignition config files that you generated with the installation program.

### Prerequisites

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

### Procedure

1. Change to the directory that contains the installation program and run the following command:

```

$ ./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level info 2

```

1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

If the command exits without a **FATAL** warning, your production control plane has initialized.

2. Delete the bootstrap resources:

```

$ az network nsg rule delete -g ${RESOURCE_GROUP} --nsg-name ${INFRA_ID}-nsg --
name bootstrap_ssh_in
$ az vm stop -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm deallocate -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap
$ az vm delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap --yes
$ az disk delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap OSDisk --no-
wait --yes
$ az network nic delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-nic --no-
wait
$ az storage blob delete --account-key ${ACCOUNT_KEY} --account-name
${CLUSTER_NAME}sa --container-name files --name bootstrap.ign
$ az network public-ip delete -g ${RESOURCE_GROUP} --name ${INFRA_ID}-bootstrap-
ssh-pip

```

**NOTE**

If you do not delete the bootstrap server, installation may not succeed due to API traffic being routed to the bootstrap server.

**6.4.17. Creating additional worker machines in Azure Stack Hub**

You can create worker machines in Microsoft Azure Stack Hub for your cluster to use by launching individual instances discretely or by automated processes outside the cluster, such as auto scaling groups. You can also take advantage of the built-in cluster scaling mechanisms and the machine API in OpenShift Container Platform.

In this example, you manually launch one instance by using the Azure Resource Manager (ARM) template. Additional instances can be launched by including additional resources of type **06\_workers.json** in the file.

**NOTE**

If you do not use the provided ARM template to create your worker machines, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- Configure an Azure account.
- Generate the Ignition config files for your cluster.
- Create and configure a VNet and associated subnets in Azure Stack Hub.
- Create and configure networking and load balancers in Azure Stack Hub.
- Create control plane and compute roles.
- Create the bootstrap machine.
- Create the control plane machines.

**Procedure**

1. Copy the template from the **ARM template for worker machines** section of this topic and save it as **06\_workers.json** in your cluster's installation directory. This template describes the worker machines that your cluster requires.
2. Export the following variable needed by the worker machine deployment:

```
$ export WORKER_IGNITION=`cat <installation_directory>/worker.ign | base64 | tr -d '\n'`
```

3. Create the deployment by using the **az** CLI:

```
$ az deployment group create -g ${RESOURCE_GROUP} \
  --template-file "<installation_directory>/06_workers.json" \
  --parameters workerIgnition="${WORKER_IGNITION}" \ 1
```

```
--parameters sshKeyData="{SSH_KEY}" \ 2
--parameters baseName="{INFRA_ID}" 3
--parameters diagnosticsStorageAccountName="{CLUSTER_NAME}sa" 4
```

- 1 The Ignition content for the worker nodes.
- 2 The SSH RSA public key file as a string.
- 3 The base name to be used in resource names; this is usually the cluster's infrastructure ID.
- 4 The name of the storage account for your cluster.

### 6.4.17.1. ARM template for worker machines

You can use the following Azure Resource Manager (ARM) template to deploy the worker machines that you need for your OpenShift Container Platform cluster:

#### Example 6.6. 06\_workers.json ARM template

```
link:https://raw.githubusercontent.com/openshift/installer/release-4.9/upi/azurestack/06_workers.json[]
```

### 6.4.18. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**. To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 6.4.19. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 6.4.20. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

#### Prerequisites

- You added machines to your cluster.

#### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS  ROLES  AGE  VERSION
master-0  Ready   master 63m  v1.22.1
master-1  Ready   master 63m  v1.22.1
master-2  Ready   master 64m  v1.22.1
```

The output lists all of the machines that you created.

#### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

- Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

#### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-8b2br 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
csr-8vnps 15m   system:serviceaccount:openshift-machine-config-operator:node-
bootstrapper Pending
...
```

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

- If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

#### NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

#### NOTE

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrapper** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

**1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}\n{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

#### NOTE

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

#### Example output

```
NAME      AGE   REQUESTOR                                     CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

**1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{\n"}\n{{end}}\n{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

#### Example output

```
NAME      STATUS   ROLES    AGE   VERSION
master-0 Ready    master   73m   v1.22.1
```

```

master-1 Ready   master 73m v1.22.1
master-2 Ready   master 74m v1.22.1
worker-0 Ready   worker 11m v1.22.1
worker-1 Ready   worker 11m v1.22.1

```

## NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

### 6.4.21. Adding the Ingress DNS records

If you removed the DNS Zone configuration when creating Kubernetes manifests and generating Ignition configs, you must manually create DNS records that point at the Ingress load balancer. You can create either a wildcard **\*.apps.{baseDomain}**, or specific records. You can use A, CNAME, and other records per your requirements.

### Prerequisites

- You deployed an OpenShift Container Platform cluster on Microsoft Azure Stack Hub by using infrastructure that you provisioned.
- Install the OpenShift CLI (**oc**).
- Install or update the [Azure CLI](#).

### Procedure

1. Confirm the Ingress router has created a load balancer and populated the **EXTERNAL-IP** field:

```
$ oc -n openshift-ingress get service router-default
```

### Example output

```

NAME          TYPE          CLUSTER-IP    EXTERNAL-IP    PORT(S)          AGE
router-default LoadBalancer  172.30.20.10  35.130.120.110 80:32288/TCP,443:31215/TCP 20

```

2. Export the Ingress router IP as a variable:

```
$ export PUBLIC_IP_ROUTER=`oc -n openshift-ingress get service router-default --no-headers | awk '{print $4}'`
```

3. Add a **\*.apps** record to the DNS zone.

- a. If you are adding this cluster to a new DNS zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -z ${CLUSTER_NAME}.${BASE_DOMAIN} -n *.apps -a ${PUBLIC_IP_ROUTER} --ttl 300
```

b. If you are adding this cluster to an already existing DNS zone, run:

```
$ az network dns record-set a add-record -g ${BASE_DOMAIN_RESOURCE_GROUP} -
z ${BASE_DOMAIN} -n *.apps.${CLUSTER_NAME} -a ${PUBLIC_IP_ROUTER} --ttl 300
```

If you prefer to add explicit domains instead of using a wildcard, you can create entries for each of the cluster's current routes:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}{"\n"}{end}
{end}' routes
```

### Example output

```
oauth-openshift.apps.cluster.basedomain.com
console-openshift-console.apps.cluster.basedomain.com
downloads-openshift-console.apps.cluster.basedomain.com
alertmanager-main-openshift-monitoring.apps.cluster.basedomain.com
grafana-openshift-monitoring.apps.cluster.basedomain.com
prometheus-k8s-openshift-monitoring.apps.cluster.basedomain.com
```

## 6.4.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Microsoft Azure Stack Hub user-provisioned infrastructure, you can monitor the cluster events until the cluster is ready.

### Prerequisites

- Deploy the bootstrap machine for an OpenShift Container Platform cluster on user-provisioned Azure Stack Hub infrastructure.
- Install the **oc** CLI and log in.

### Procedure

- Complete the cluster installation:

```
$ ./openshift-install --dir <installation_directory> wait-for install-complete 1
```

### Example output

```
INFO Waiting up to 30m0s for the cluster to initialize...
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

## CHAPTER 7. INSTALLING ON GCP

### 7.1. PREPARING TO INSTALL ON GCP

#### 7.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 7.1.2. Requirements for installing OpenShift Container Platform on GCP

Before installing OpenShift Container Platform on Google Cloud Platform (GCP), you must create a service account and configure a GCP project. See [Configuring a GCP project](#) for details about creating a project, enabling API services, configuring DNS, GCP account limits, and supported GCP regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating IAM for GCP](#) for other options.

#### 7.1.3. Choosing a method to install OpenShift Container Platform on GCP

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 7.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on GCP** You can install OpenShift Container Platform on GCP infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- **Installing a customized cluster on GCP** You can install a customized cluster on GCP infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- **Installing a cluster on GCP with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- **Installing a cluster on GCP in a restricted network** You can install OpenShift Container Platform on GCP on installer-provisioned infrastructure by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an

active internet connection to obtain the software components. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the GCP APIs.

- **Installing a cluster into an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing GCP Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits on creating new accounts or infrastructure.
- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing GCP VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.

### 7.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on GCP infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on GCP with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP infrastructure that you provide. You can use the provided Deployment Manager templates to assist with the installation.
- **Installing a cluster with shared VPC on user-provisioned infrastructure in GCP** You can use the provided Deployment Manager templates to create GCP resources in a shared VPC infrastructure.
- **Installing a cluster on GCP in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on GCP in a restricted network with user-provisioned infrastructure. By creating an internal mirror of the installation release content, you can install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content.

### 7.1.4. Next steps

- [Configuring a GCP project](#)

## 7.2. CONFIGURING A GCP PROJECT

Before you can install OpenShift Container Platform, you must configure a Google Cloud Platform (GCP) project to host it.

### 7.2.1. Creating a GCP project

To install OpenShift Container Platform, you must create a project in your Google Cloud Platform (GCP) account to host the cluster.

#### Procedure

- Create a project to host your OpenShift Container Platform cluster. See [Creating and Managing Projects](#) in the GCP documentation.

## IMPORTANT

Your GCP project must use the Premium Network Service Tier if you are using installer-provisioned infrastructure. The Standard Network Service Tier is not supported for clusters installed using the installation program. The installation program configures internal load balancing for the **api-int.<cluster\_name>.<base\_domain>** URL; the Premium Tier is required for internal load balancing.

### 7.2.2. Enabling API services in GCP

Your Google Cloud Platform (GCP) project requires access to several API services to complete OpenShift Container Platform installation.

#### Prerequisites

- You created a project to host your cluster.

#### Procedure

- Enable the following required API services in the project that hosts your cluster. See [Enabling services](#) in the GCP documentation.

**Table 7.1. Required API services**

API service	Console service name
Compute Engine API	<b>compute.googleapis.com</b>
Google Cloud APIs	<b>cloudapis.googleapis.com</b>
Cloud Resource Manager API	<b>cloudresourcemanager.googleapis.com</b>
Google DNS API	<b>dns.googleapis.com</b>
IAM Service Account Credentials API	<b>iamcredentials.googleapis.com</b>
Identity and Access Management (IAM) API	<b>iam.googleapis.com</b>
Service Management API	<b>servicemanagement.googleapis.com</b>
Service Usage API	<b>serviceusage.googleapis.com</b>
Google Cloud Storage JSON API	<b>storage-api.googleapis.com</b>
Cloud Storage	<b>storage-component.googleapis.com</b>

### 7.2.3. Configuring DNS for GCP

To install OpenShift Container Platform, the Google Cloud Platform (GCP) account you use must have a dedicated public hosted zone in the same project that you host the OpenShift Container Platform

cluster. This zone must be authoritative for the domain. The DNS service provides cluster DNS resolution and name lookup for external connections to the cluster.

## Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through GCP or another source.

### NOTE

If you purchase a new domain, it can take time for the relevant DNS changes to propagate. For more information about purchasing domains through Google, see [Google Domains](#).

2. Create a public hosted zone for your domain or subdomain in your GCP project. See [Creating public zones](#) in the GCP documentation. Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
3. Extract the new authoritative name servers from the hosted zone records. See [Look up your Cloud DNS name servers](#) in the GCP documentation. You typically have four name servers.
4. Update the registrar records for the name servers that your domain uses. For example, if you registered your domain to Google Domains, see the following topic in the Google Domains Help: [How to switch to custom name servers](#).
5. If you migrated your root domain to Google Cloud DNS, migrate your DNS records. See [Migrating to Cloud DNS](#) in the GCP documentation.
6. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain. This process might include a request to your company's IT department or the division that controls the root domain and DNS services for your company.

## 7.2.4. GCP account limits

The OpenShift Container Platform cluster uses a number of Google Cloud Platform (GCP) components, but the default [Quotas](#) do not affect your ability to install a default OpenShift Container Platform cluster.

A default cluster, which contains three compute and three control plane machines, uses the following resources. Note that some resources are required only during the bootstrap process and are removed after the cluster deploys.

**Table 7.2. GCP resources used in a default cluster**

Service	Component	Location	Total resources required	Resources removed after bootstrap
Service account	IAM	Global	5	0
Firewall rules	Compute	Global	11	1

Service	Component	Location	Total resources required	Resources removed after bootstrap
Forwarding rules	Compute	Global	2	0
In-use global IP addresses	Compute	Global	4	1
Health checks	Compute	Global	3	0
Images	Compute	Global	1	0
Networks	Compute	Global	2	0
Static IP addresses	Compute	Region	4	1
Routers	Compute	Global	1	0
Routes	Compute	Global	2	0
Subnetworks	Compute	Global	2	0
Target pools	Compute	Global	3	0
CPUs	Compute	Region	28	4
Persistent disk SSD (GB)	Compute	Region	896	128

## NOTE

If any of the quotas are insufficient during installation, the installation program displays an error that states both which quota was exceeded and the region.

Be sure to consider your actual cluster size, planned cluster growth, and any usage from other clusters that are associated with your account. The CPU, static IP addresses, and persistent disk SSD (storage) quotas are the ones that are most likely to be insufficient.

If you plan to deploy your cluster in one of the following regions, you will exceed the maximum storage quota and are likely to exceed the CPU quota limit:

- **asia-east2**
- **asia-northeast2**
- **asia-south1**
- **australia-southeast1**

- **europa-north1**
- **europa-west2**
- **europa-west3**
- **europa-west6**
- **northamerica-northeast1**
- **southamerica-east1**
- **us-west2**

You can increase resource quotas from the [GCP console](#), but you might need to file a support ticket. Be sure to plan your cluster size early so that you can allow time to resolve the support ticket before you install your OpenShift Container Platform cluster.

## 7.2.5. Creating a service account in GCP

OpenShift Container Platform requires a Google Cloud Platform (GCP) service account that provides authentication and authorization to access data in the Google APIs. If you do not have an existing IAM service account that contains the required roles in your project, you must create one.

### Prerequisites

- You created a project to host your cluster.

### Procedure

1. Create a service account in the project that you use to host your OpenShift Container Platform cluster. See [Creating a service account](#) in the GCP documentation.
2. Grant the service account the appropriate permissions. You can either grant the individual permissions that follow or assign the **Owner** role to it. See [Granting roles to a service account for specific resources](#).

### NOTE

While making the service account an owner of the project is the easiest way to gain the required permissions, it means that service account has complete control over the project. You must determine if the risk that comes from offering that power is acceptable.

3. Create the service account key in JSON format. See [Creating service account keys](#) in the GCP documentation.  
The service account key is required to create a cluster.

### 7.2.5.1. Required GCP permissions

When you attach the **Owner** role to the service account that you create, you grant that service account all permissions, including those that are required to install OpenShift Container Platform. To deploy an OpenShift Container Platform cluster, the service account requires the following permissions. If you deploy your cluster into an existing VPC, the service account does not require certain networking permissions, which are noted in the following lists:

### Required roles for the installation program

- Compute Admin
- Security Admin
- Service Account Admin
- Service Account User
- Storage Admin

### Required roles for creating network resources during installation

- DNS Administrator

### Optional roles

For the cluster to create new limited credentials for its Operators, add the following role:

- Service Account Key Admin

The roles are applied to the service accounts that the control plane and compute machines use:

**Table 7.3. GCP service account permissions**

Account	Roles
Control Plane	<b>roles/compute.instanceAdmin</b>
	<b>roles/compute.networkAdmin</b>
	<b>roles/compute.securityAdmin</b>
	<b>roles/storage.admin</b>
	<b>roles/iam.serviceAccountUser</b>
Compute	<b>roles/compute.viewer</b>
	<b>roles/storage.admin</b>

### 7.2.6. Supported GCP regions

You can deploy an OpenShift Container Platform cluster to the following Google Cloud Platform (GCP) regions:

- **asia-east1** (Changhua County, Taiwan)
- **asia-east2** (Hong Kong)
- **asia-northeast1** (Tokyo, Japan)
- **asia-northeast2** (Osaka, Japan)

- **asia-northeast3** (Seoul, South Korea)
- **asia-south1** (Mumbai, India)
- **asia-southeast1** (Jurong West, Singapore)
- **asia-southeast2** (Jakarta, Indonesia)
- **australia-southeast1** (Sydney, Australia)
- **europa-central2** (Warsaw, Poland)
- **europa-north1** (Hamina, Finland)
- **europa-west1** (St. Ghislain, Belgium)
- **europa-west2** (London, England, UK)
- **europa-west3** (Frankfurt, Germany)
- **europa-west4** (Eemshaven, Netherlands)
- **europa-west6** (Zürich, Switzerland)
- **northamerica-northeast1** (Montréal, Québec, Canada)
- **southamerica-east1** (São Paulo, Brazil)
- **us-central1** (Council Bluffs, Iowa, USA)
- **us-east1** (Moncks Corner, South Carolina, USA)
- **us-east4** (Ashburn, Northern Virginia, USA)
- **us-west1** (The Dalles, Oregon, USA)
- **us-west2** (Los Angeles, California, USA)
- **us-west3** (Salt Lake City, Utah, USA)
- **us-west4** (Las Vegas, Nevada, USA)

### 7.2.7. Next steps

- Install an OpenShift Container Platform cluster on GCP. You can [install a customized cluster](#) or [quickly install a cluster](#) with default options.

## 7.3. MANUALLY CREATING IAM FOR GCP

In environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace, you can put the Cloud Credential Operator (CCO) into manual mode before you install the cluster.

### 7.3.1. Alternatives to storing administrator-level secrets in the kube-system project

The Cloud Credential Operator (CCO) manages cloud provider credentials as Kubernetes custom resource definitions (CRDs). You can configure the CCO to suit the security requirements of your organization by setting different values for the **credentialsMode** parameter in the **install-config.yaml** file.

If you prefer not to store an administrator-level credential secret in the cluster **kube-system** project, you can choose one of the following options when installing OpenShift Container Platform:

- **Manage cloud credentials manually.**

You can set the **credentialsMode** parameter for the CCO to **Manual** to manage cloud credentials manually. Using manual mode allows each cluster component to have only the permissions it requires, without storing an administrator-level credential in the cluster. You can also use this mode if your environment does not have connectivity to the cloud provider public IAM endpoint. However, you must manually reconcile permissions with new release images for every upgrade. You must also manually supply credentials for every component that requests them.

- **Remove the administrator-level credential secret after installing OpenShift Container Platform with mint mode:**

If you are using the CCO with the **credentialsMode** parameter set to **Mint**, you can remove or rotate the administrator-level credential after installing OpenShift Container Platform. Mint mode is the default configuration for the CCO. This option requires the presence of the administrator-level credential during an installation. The administrator-level credential is used during the installation to mint other credentials with some permissions granted. The original credential secret is not stored in the cluster permanently.

#### NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

#### Additional resources

- [Rotating or removing cloud provider credentials.](#)

For a detailed description of all available CCO credential modes and their supported platforms, see [About the Cloud Credential Operator](#).

### 7.3.2. Manually create IAM

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

#### Procedure

1. Change to the directory that contains the installation program and create the **install-config.yaml** file by running the following command:

```
$ openshift-install create install-config --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

2. Edit the **install-config.yaml** configuration file so that it contains the **credentialsMode** parameter set to **Manual**.

### Example install-config.yaml configuration file

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** This line is added to set the **credentialsMode** parameter to **Manual**.

3. To generate the manifests, run the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

4. From the directory that contains the installation program, obtain details of the OpenShift Container Platform release image that your **openshift-install** binary is built to use by running the following command:

```
$ openshift-install version
```

### Example output

```
release image quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64
```

5. Locate all **CredentialsRequest** objects in this release image that target the cloud you are deploying on by running the following command:

```
$ oc adm release extract quay.io/openshift-release-dev/ocp-release:4.y.z-x86_64 \
--credentials-requests \
--cloud=gcp
```

This command creates a YAML file for each **CredentialsRequest** object.

### Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: GCPProviderSpec
```

```

predefinedRoles:
- roles/storage.admin
- roles/iam.serviceAccountUser
skipServiceCheck: true
...

```

6. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample CredentialsRequest object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component-credentials-request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    ...
  secretRef:
    name: <component-secret>
    namespace: <component-namespace>
  ...

```

### Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component-secret>
  namespace: <component-namespace>
data:
  service_account.json: <base64_encoded_gcp_service_account_file>

```

### IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state. For details, see the "Upgrading clusters with manually maintained credentials" section of the installation content for your cloud provider.

### 7.3.3. Upgrading clusters with manually maintained credentials

The Cloud Credential Operator (CCO) **Upgradable** status for a cluster with manually maintained credentials is **False** by default.

- For minor releases, for example, from 4.8 to 4.9, this status prevents you from upgrading until you have addressed any updated permissions and annotated the **CloudCredential** resource to indicate that the permissions are updated as needed for the next version. This annotation changes the **Upgradable** status to **True**.

- For z-stream releases, for example, from 4.9.0 to 4.9.1, no permissions are added or changed, so the upgrade is not blocked.

Before upgrading a cluster with manually maintained credentials, you must create any new credentials for the release image that you are upgrading to. Additionally, you must review the required permissions for existing credentials and accommodate any new permissions requirements in the new release for those components.

## Procedure

1. Extract and examine the **CredentialsRequest** custom resource for the new release. The "Manually creating IAM" section of the installation content for your cloud provider explains how to obtain and use the credentials required for your cloud.
2. Update the manually maintained credentials on your cluster:
  - Create new secrets for any **CredentialsRequest** custom resources that are added by the new release image.
  - If the **CredentialsRequest** custom resources for any existing credentials that are stored in secrets have changed their permissions requirements, update the permissions as required.
3. When all of the secrets are correct for the new release, indicate that the cluster is ready to upgrade:
  - a. Log in to the OpenShift Container Platform CLI as a user with the **cluster-admin** role.
  - b. Edit the **CloudCredential** resource to add an **upgradeable-to** annotation within the **metadata** field:

```
$ oc edit cloudcredential cluster
```

### Text to add

```
...
  metadata:
    annotations:
      cloudcredential.openshift.io/upgradeable-to: <version_number>
  ...
```

Where **<version\_number>** is the version you are upgrading to, in the format **x.y.z**. For example, **4.8.2** for OpenShift Container Platform 4.8.2.

It may take several minutes after adding the annotation for the upgradeable status to change.

4. Verify that the CCO is upgradeable:
  - a. In the **Administrator** perspective of the web console, navigate to **Administration** → **Cluster Settings**.
  - b. To view the CCO status details, click **cloud-credential** in the **Cluster Operators** list.
  - c. If the **Upgradeable** status in the **Conditions** section is **False**, verify that the **upgradeable-to** annotation is free of typographical errors.

When the **Upgradeable** status in the **Conditions** section is **True**, you can begin the OpenShift Container Platform upgrade.

:\_content-type: CONCEPT

### 7.3.4. Mint mode

Mint mode is the default Cloud Credential Operator (CCO) credentials mode for OpenShift Container Platform. In this mode, the CCO uses the provided administrator-level cloud credential to run the cluster. Mint mode is supported for AWS and GCP.

In mint mode, the **admin** credential is stored in the **kube-system** namespace and then used by the CCO to process the **CredentialsRequest** objects in the cluster and create users for each with specific permissions.

The benefits of mint mode include:

- Each cluster component has only the permissions it requires
- Automatic, on-going reconciliation for cloud credentials, including additional credentials or permissions that might be required for upgrades

One drawback is that mint mode requires **admin** credential storage in a cluster **kube-system** secret.

### 7.3.5. Mint mode with removal or rotation of the administrator-level credential

Currently, this mode is only supported on AWS and GCP.

In this mode, a user installs OpenShift Container Platform with an administrator-level credential just like the normal mint mode. However, this process removes the administrator-level credential secret from the cluster post-installation.

The administrator can have the Cloud Credential Operator make its own request for a read-only credential that allows it to verify if all **CredentialsRequest** objects have their required permissions, thus the administrator-level credential is not required unless something needs to be changed. After the associated credential is removed, it can be deleted or deactivated on the underlying cloud, if desired.

#### NOTE

Prior to a non z-stream upgrade, you must reinstate the credential secret with the administrator-level credential. If the credential is not present, the upgrade might be blocked.

The administrator-level credential is not stored in the cluster permanently.

Following these steps still requires the administrator-level credential in the cluster for brief periods of time. It also requires manually re-instating the secret with administrator-level credentials for each upgrade.

### 7.3.6. Next steps

- Install an OpenShift Container Platform cluster:

- [Installing a cluster quickly on GCP](#) with default options on installer-provisioned infrastructure
- [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
- [Install a cluster with network customizations on installer-provisioned infrastructure](#)

## 7.4. INSTALLING A CLUSTER QUICKLY ON GCP

In OpenShift Container Platform version 4.9, you can install a cluster on Google Cloud Platform (GCP) that uses the default configuration options.

### 7.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 7.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 7.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes

through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the **GOOGLE\_APPLICATION\_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**7.4.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on a local computer.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

## Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 7.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

## Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
  - The **GOOGLE\_CREDENTIALS**, **GOOGLE\_CLOUD\_KEYFILE\_JSON**, or **GKLOUD\_KEYFILE\_JSON** environment variables
  - The `~/.gcp/osServiceAccount.json` file
  - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For `<installation_directory>`, specify the directory name to store the files that the installation program creates.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **gcp** as the platform to target.
- c. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
- d. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
- e. Select the region to deploy the cluster to.
- f. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

- g. Enter a descriptive name for your cluster. If you provide a name that is longer than 6 characters, only the first 6 characters will be used in the infrastructure ID that is generated from the cluster name.
- h. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
  - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
  - If you included the **Service Account Key Admin** role, you can remove it.

### 7.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version in the **Version** drop-down menu.
- Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
- Unpack the archive:

```
$ tar xvf <file>
```

- Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version in the **Version** drop-down menu.
- Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.

4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 7.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For `<installation_directory>`, specify the path to the directory that you stored the installation files in.

2. Verify you can run `oc` commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 7.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 7.4.9. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 7.5. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.9, you can install a customized cluster on infrastructure that the installation program provisions on Google Cloud Platform (GCP). To customize the installation, you modify parameters in the `install-config.yaml` file before you install the cluster.

### 7.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

## 7.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

## 7.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

### Example output

```
Agent pid 31874
```

### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

■

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the **GOOGLE\_APPLICATION\_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 7.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

## IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 7.5.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

#### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

#### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

## IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:

- i. Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
  - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
  - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
  - v. Select the region to deploy the cluster to.
  - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
  - vii. Enter a descriptive name for your cluster.
  - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 7.5.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

## 7.5.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 7.4. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 7.5.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 7.5. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 7.5.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 7.6. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="486 1093 593 1411" style="background-color: black; color: white; padding: 5px; display: inline-block; font-size: 0.8em; margin-bottom: 10px;">  </div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported. If you are installing on GCP into a shared virtual private cloud (VPC), <b>credentialsMode</b> must be set to <b>Passthrough</b>.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 40px; height: 40px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 7.5.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 7.7. Additional GCP parameters

Parameter	Description	Values
<b>platform.gcp.network</b>	The name of the existing VPC that you want to deploy your cluster to.	String.
<b>platform.gcp.region</b>	The name of the GCP region that hosts your cluster.	Any valid region name, such as <b>us-central1</b> .
<b>platform.gcp.type</b>	The <a href="#">GCP machine type</a> .	The GCP machine type.
<b>platform.gcp.zones</b>	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid <a href="#">GCP availability zones</a> , such as <b>us-central1-a</b> , in a <a href="#">YAML sequence</a> .
<b>platform.gcp.controlPlaneSubnet</b>	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p><b>IMPORTANT</b></p> <p>The <b>licenses</b> parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the <a href="#">license API</a> , such as the license to enable <a href="#">nested virtualization</a> . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default <b>pd-ssd</b> or the <b>pd-standard</b> disk type. The control plane nodes must be the <b>pd-ssd</b> disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
<b>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing</b>	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<b>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyLocation</b>	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<b>controlPlane.platform.gcp.osDisk.encryptionKey.projectID</b>	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
<b>computePlatform.gcp.osDisk.encryptionKey.kmsKeyName</b>	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

### 7.5.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 7.8. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 7.5.5.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines. For more information, see "Minimum resource requirements for cluster installation".
- The name of the custom machine type must adhere to the following syntax:  
**custom-<number\_of\_cpus>-<amount\_of\_memory\_in\_mb>**

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

#### Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
```

```

gcp:
  type: custom-6-20480
  replicas: 3

```

#### 7.5.5.4. Sample customized install-config.yaml file for GCP

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
  - hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id

```

```

replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
    - 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 11
    region: us-central1 12
  pullSecret: '{"auths": ...}' 13
  fips: false 14
  sshKey: ssh-ed25519 AAAA... 15

```

- 1 10 11 12 13** Required. The installation program prompts you for this value.
- 2 6** If you do not provide these parameters and values, the installation program provides the default value.
- 3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-`<project_number>`@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".
- 14** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

## IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

**15**

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

## NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

### 7.5.5.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2

```

```
noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1** A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2** A proxy URL to use for creating HTTPS connections outside the cluster.
- 3** A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4** If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 7.5.6. Using a GCP Marketplace image

If you want to deploy an OpenShift Container Platform cluster using a GCP Marketplace image, you must create the manifests and edit the compute machine set definitions to specify the GCP Marketplace image.

#### Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Generate the installation manifests by running the following command:

```
$ openshift-install create manifests --dir <installation_dir>
```

2. Locate the following files:

- `<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-0.yaml`
- `<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-1.yaml`
- `<installation_dir>/openshift/99_openshift-cluster-api_worker-machineset-2.yaml`

3. In each file, edit the `.spec.template.spec.providerSpec.value.disks[0].image` property to reference the offer to use:

#### OpenShift Container Platform

```
projects/redhat-marketplace-public/global/images/redhat-coreos-ocp-48-x86-64-202210040145
```

#### OpenShift Platform Plus

```
projects/redhat-marketplace-public/global/images/redhat-coreos-opp-48-x86-64-202206140145
```

#### OpenShift Kubernetes Engine

```
projects/redhat-marketplace-public/global/images/redhat-coreos-oke-48-x86-64-202206140145
```

### Example compute machine set with the GCP Marketplace image

```
deletionProtection: false
disks:
- autoDelete: true
  boot: true
  image: projects/redhat-marketplace-public/global/images/redhat-coreos-ocp-48-x86-64-202210040145
  labels: null
  sizeGb: 128
  type: pd-ssd
kind: GCPMachineProviderSpec
machineType: n2-standard-4
```

## 7.5.7. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
  - The **GOOGLE\_CREDENTIALS**, **GOOGLE\_CLOUD\_KEYFILE\_JSON**, or **GKLOUD\_KEYFILE\_JSON** environment variables
  - The `~/.gcp/osServiceAccount.json` file
  - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

**IMPORTANT**

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

**IMPORTANT**

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
  - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
  - If you included the **Service Account Key Admin** role, you can remove it.

### 7.5.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

- 5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 7.5.9. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 7.5.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 7.5.11. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 7.6. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.9, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Google Cloud Platform (GCP). By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### 7.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### 7.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

**7.6.3. Generating a key pair for cluster node SSH access**

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

- Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

- Verify that the credentials were applied.

```
$ gcloud auth list
```

## Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 7.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 7.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

## Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

## Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$. /openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
- iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
- iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
- v. Select the region to deploy the cluster to.
- vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
- vii. Enter a descriptive name for your cluster.

- viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 7.6.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

##### 7.6.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 7.9. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String

Parameter	Description	Values
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws, baremetal, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 7.6.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 7.10. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object  <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 7.6.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 7.11. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;"> <div style="background-color: black; width: 20px; height: 100px; margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="485 1093 592 1411" style="background-color: black; color: white; padding: 5px; width: 60px; height: 140px; margin-bottom: 10px;"> </div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported. If you are installing on GCP into a shared virtual private cloud (VPC), <b>credentialsMode</b> must be set to <b>Passthrough</b>.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 7.6.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 7.12. Additional GCP parameters

Parameter	Description	Values
<b>platform.gcp.network</b>	The name of the existing VPC that you want to deploy your cluster to.	String.
<b>platform.gcp.region</b>	The name of the GCP region that hosts your cluster.	Any valid region name, such as <b>us-central1</b> .
<b>platform.gcp.type</b>	The <a href="#">GCP machine type</a> .	The GCP machine type.
<b>platform.gcp.zones</b>	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid <a href="#">GCP availability zones</a> , such as <b>us-central1-a</b> , in a <a href="#">YAML sequence</a> .
<b>platform.gcp.controlPlaneSubnet</b>	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p><b>IMPORTANT</b></p> <p>The <b>licenses</b> parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the <a href="#">license API</a> , such as the license to enable <a href="#">nested virtualization</a> . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default <b>pd-ssd</b> or the <b>pd-standard</b> disk type. The control plane nodes must be the <b>pd-ssd</b> disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>controlplane.platform.gcp.osDiskEncryptionKey.kmsKeyRing</code>	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>controlplane.platform.gcp.osDiskEncryptionKey.kmsLocation</code>	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>controlplane.platform.gcp.osDiskEncryptionKey.projectID</code>	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
<code>compute.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

### 7.6.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 7.13. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 7.6.5.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines. For more information, see "Minimum resource requirements for cluster installation".
- The name of the custom machine type must adhere to the following syntax:  
**custom-<number\_of\_cpus>-<amount\_of\_memory\_in\_mb>**

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

#### Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
```

```

gcp:
  type: custom-6-20480
  replicas: 3

```

#### 7.6.5.4. Sample customized install-config.yaml file for GCP

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
  - hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id

```

```

replicas: 3
metadata:
  name: test-cluster 10
networking: 11
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 12
    region: us-central1 13
  pullSecret: '{"auths": ...}' 14
  fips: false 15
  sshKey: ssh-ed25519 AAAA... 16

```

**1 10 12 13 14** Required. The installation program prompts you for this value.

**2 6 11** If you do not provide these parameters and values, the installation program provides the default value.

**3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

**4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

**5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-`<project_number>`@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

**15** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

**16**

You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

**7.6.6. Additional resources**

- [Enabling customer-managed encryption keys for a machine set](#)

**7.6.6.1. Configuring the cluster-wide proxy during installation**

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

**Prerequisites**

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

**NOTE**

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

**Procedure**

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
```

```

httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
noProxy: example.com 3
additionalTrustBundle: | 4
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 7.6.7. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**

- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

#### NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

### Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the cluster network provider during phase 2.

### 7.6.8. Specifying advanced network configuration

You can use advanced network configuration for your cluster network provider to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

#### IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

#### Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

#### Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
```

```
name: cluster
spec:
```

- Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

#### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

#### Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

- Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

## 7.6.9. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group and these fields cannot be changed:

### **clusterNetwork**

IP address pools from which pod IP addresses are allocated.

### **serviceNetwork**

IP address pool for services.

### **defaultNetwork.type**

Cluster network provider, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network provider configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

### 7.6.9.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 7.14. Cluster Network Operator configuration object**

Field	Type	Description
<b>metadata.name</b>	<b>string</b>	The name of the CNO object. This name is always <b>cluster</b> .
<b>spec.clusterNetwork</b>	<b>array</b>	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:   - cidr: 10.128.0.0/19     hostPrefix: 23   - cidr: 10.128.32.0/19     hostPrefix: 23</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.serviceNetwork</b>	<b>array</b>	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes Container Network Interface (CNI) network providers support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:   - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p>
<b>spec.defaultNetwork</b>	<b>object</b>	Configures the Container Network Interface (CNI) cluster network provider for the cluster network.
<b>spec.kubeProxy</b> <b>Config</b>	<b>object</b>	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network provider, the kube-proxy configuration has no effect.

#### defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

**Table 7.15. defaultNetwork object**

Field	Type	Description
-------	------	-------------

Field	Type	Description
<b>type</b>	<b>string</b>	<p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The cluster network provider is selected during installation. This value cannot be changed after cluster installation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>OpenShift Container Platform uses the OpenShift SDN Container Network Interface (CNI) cluster network provider by default.</p> </div> </div>
<b>openshiftSDNConfig</b>	<b>object</b>	This object is only valid for the OpenShift SDN cluster network provider.
<b>ovnKubernetesConfig</b>	<b>object</b>	This object is only valid for the OVN-Kubernetes cluster network provider.

### Configuration for the OpenShift SDN CNI cluster network provider

The following table describes the configuration fields for the OpenShift SDN Container Network Interface (CNI) cluster network provider.

Table 7.16. **openshiftSDNConfig** object

Field	Type	Description
<b>mode</b>	<b>string</b>	<p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p>

Field	Type	Description
<b>vxlanPort</b>	<b>integer</b>	<p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>

### Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

### Configuration for the OVN-Kubernetes CNI cluster network provider

The following table describes the configuration fields for the OVN-Kubernetes CNI cluster network provider.

Table 7.17. `ovnKubernetesConfig` object

Field	Type	Description
<b>mtu</b>	<b>integer</b>	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p> <p>This value cannot be changed after cluster installation.</p>
<b>genevePort</b>	<b>integer</b>	<p>The port to use for all Geneve packets. The default value is <b>6081</b>. This value cannot be changed after cluster installation.</p>

Field	Type	Description
<b>ipsecConfig</b>	<b>object</b>	Specify an empty object to enable IPsec encryption. This value cannot be changed after cluster installation.
<b>policyAuditConfig</b>	<b>object</b>	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.

Table 7.18. **policyAuditConfig** object

Field	Type	Description
<b>rateLimit</b>	integer	The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second.
<b>maxFileSize</b>	integer	The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.
<b>destination</b>	string	One of the following additional audit log targets: <ul style="list-style-type: none"> <li><b>libc</b> The libc <b>syslog()</b> function of the journald process on the host.</li> <li><b>udp:&lt;host&gt;:&lt;port&gt;</b> A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server.</li> <li><b>unix:&lt;file&gt;</b> A Unix Domain Socket file specified by <b>&lt;file&gt;</b>.</li> <li><b>null</b> Do not send the audit logs to any additional target.</li> </ul>
<b>syslogFacility</b>	string	The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .

### Example OVN-Kubernetes configuration

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

### kubeProxyConfig object configuration

The values for the **kubeProxyConfig** object are defined in the following table:

Table 7.19. **kubeProxyConfig** object

Field	Type	Description
<b>iptablesSyncPeriod</b>	<b>string</b>	<p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div>
<b>proxyArguments.iptables-min-sync-period</b>	<b>array</b>	<p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>

## 7.6.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For `<installation_directory>`, specify the
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

#### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

#### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

#### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 7.6.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 7.6.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

## Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 7.6.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 7.6.14. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 7.7. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK

In OpenShift Container Platform 4.9, you can install a cluster on Google Cloud Platform (GCP) in a restricted network by creating an internal mirror of the installation release content on an existing Google Virtual Private Cloud (VPC).

### IMPORTANT

You can install an OpenShift Container Platform cluster by using mirrored installation release content, but your cluster will require internet access to use the GCP APIs.

### 7.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

## IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in GCP. While installing a cluster in a restricted network that uses installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
  - Contains the mirror registry
  - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to. While you might need to grant access to more sites, you must grant access to **\*.googleapis.com** and **accounts.google.com**.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 7.7.2. About installations in restricted networks

In OpenShift Container Platform 4.9, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift Container Platform registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

#### 7.7.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

### 7.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 7.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the **GOOGLE\_APPLICATION\_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 7.7.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- Have the **imageContentSources** values that were generated during mirror registry creation.
- Obtain the contents of the certificate for your mirror registry.
- Obtain service principal permissions at the subscription level.

### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
  - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
  - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
  - v. Select the region to deploy the cluster to.
  - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
  - vii. Enter a descriptive name for your cluster.
  - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Edit the **install-config.yaml** file to provide the additional information that is required for an installation in a restricted network.
- a. Update the **pullSecret** value to contain the authentication information for your registry:

```
pullSecret: '{"auths":{"<mirror_host_name>:5000": {"auth": "<credentials>","email": "you@example.com"}}}'
```

For **<mirror\_host\_name>**, specify the registry domain name that you specified in the certificate for your mirror registry, and for **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- b. Add the **additionalTrustBundle** parameter and value.

```
additionalTrustBundle: |
  -----BEGIN CERTIFICATE-----
  /-----END CERTIFICATE-----
```

The value must be the contents of the certificate file that you used for your mirror registry, which can be an existing, trusted certificate authority or the self-signed certificate that you generated for the mirror registry.

- c. Define the network and subnets for the VPC to install the cluster in under the parent **platform.gcp** field:

```
network: <existing_vpc>
controlPlaneSubnet: <control_plane_subnet>
computeSubnet: <compute_subnet>
```

5. **platform.gcp.network** field is required only if you are installing on GCP VPC.

For **platform.gcp.network**, specify the name for the existing Google VPC. For **platform.gcp.controlPlaneSubnet** and **platform.gcp.computeSubnet**, specify the existing subnets to deploy the control plane machines and compute machines, respectively.

- d. Add the image content resources, which look like this excerpt:

```
imageContentSources:
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
    source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - <mirror_host_name>:5000/<repo_name>/release
    source: registry.redhat.io/ocp/release
```

To complete these values, use the **imageContentSources** that you recorded during mirror registry creation.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

#### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### 7.7.5.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 7.7.5.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

**Table 7.20. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 7.7.5.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 7.21. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 7.7.5.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 7.22. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported. If you are installing on GCP into a shared virtual private cloud (VPC), <b>credentialsMode</b> must be set to <b>Passthrough</b>.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators</i> reference content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 60px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 7.7.5.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 7.23. Additional GCP parameters

Parameter	Description	Values
<b>platform.gcp.network</b>	The name of the existing VPC that you want to deploy your cluster to.	String.
<b>platform.gcp.region</b>	The name of the GCP region that hosts your cluster.	Any valid region name, such as <b>us-central1</b> .
<b>platform.gcp.type</b>	The <a href="#">GCP machine type</a> .	The GCP machine type.
<b>platform.gcp.zones</b>	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid <a href="#">GCP availability zones</a> , such as <b>us-central1-a</b> , in a <a href="#">YAML sequence</a> .
<b>platform.gcp.controlPlaneSubnet</b>	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p><b>IMPORTANT</b></p> <p>The <b>licenses</b> parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the <a href="#">license API</a> , such as the license to enable <a href="#">nested virtualization</a> . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default <b>pd-ssd</b> or the <b>pd-standard</b> disk type. The control plane nodes must be the <b>pd-ssd</b> disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
<b>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing</b>	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<b>controlPlane.platform.gcp.osDisk.encryptionKey.location</b>	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<b>controlPlane.platform.gcp.osDisk.encryptionKey.projectID</b>	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
<b>computePlatform.gcp.osDisk.encryptionKey.kmsKeyName</b>	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

### 7.7.5.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 7.24. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 7.7.5.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines. For more information, see "Minimum resource requirements for cluster installation".
- The name of the custom machine type must adhere to the following syntax:  
**custom-<number\_of\_cpus>-<amount\_of\_memory\_in\_mb>**

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

#### Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
```

```

gcp:
  type: custom-6-20480
  replicas: 3

```

#### 7.7.5.4. Sample customized install-config.yaml file for GCP

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
  - hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id

```

```

replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  gcp:
  projectID: openshift-production 11
  region: us-central1 12
  network: existing_vpc 13
  controlPlaneSubnet: control_plane_subnet 14
  computeSubnet: compute_subnet 15
pullSecret: '{"auths":{"<local_registry>":{"auth": "<credentials>","email": "you@example.com"}}}' 16
fips: false 17
sshKey: ssh-ed25519 AAAA... 18
additionalTrustBundle: | 19
  -----BEGIN CERTIFICATE-----
  <MY_TRUSTED_CA_CERT>
  -----END CERTIFICATE-----
imageContentSources: 20
- mirrors:
  - <local_registry>/<local_repository_name>/release
  source: quay.io/openshift-release-dev/ocp-release
- mirrors:
  - <local_registry>/<local_repository_name>/release
  source: quay.io/openshift-release-dev/ocp-v4.0-art-dev

```

**1 10 11 12** Required. The installation program prompts you for this value.

**2 6** If you do not provide these parameters and values, the installation program provides the default value.

**3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

**4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 5 9 Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-`<project_number>`@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".
- 13 Specify the name of an existing VPC.
- 14 Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.
- 15 Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.
- 16 For **<local\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19 Provide the contents of the certificate file that you used for your mirror registry.
- 20 Provide the **imageContentSources** section from the output of the command to mirror the repository.

#### 7.7.5.5. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

## Prerequisites

- You created the **install-config.yaml** and complete any modifications to it.

## Procedure

Create an Ingress Controller with global access on a new GCP cluster.

- Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- For **<installation\_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

- Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation\_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- For **<installation\_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

## Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

- Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

## Sample clientAccess configuration to Global

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global 1
```

```

type: GCP
scope: Internal
type: LoadBalancerService

```

- 1 Set `gcp.clientAccess` to **Global**.
- 2 Global access is only available to Ingress Controllers using internal load balancers.

### 7.7.5.6. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the `install-config.yaml` file.

#### Prerequisites

- You have an existing `install-config.yaml` file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's `spec.noProxy` field to bypass the proxy if necessary.

#### NOTE

The **Proxy** object `status.noProxy` field is populated with the values of the `networking.machineNetwork[].cidr`, `networking.clusterNetwork[].cidr`, and `networking.serviceNetwork[]` fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object `status.noProxy` field is also populated with the instance metadata endpoint (`169.254.169.254`).

#### Procedure

1. Edit your `install-config.yaml` file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port>
  httpsProxy: https://<username>:<pswd>@<ip>:<port>
  noProxy: example.com
  additionalTrustBundle: |
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 7.7.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:

- The **GOOGLE\_CREDENTIALS**, **GOOGLE\_CLOUD\_KEYFILE\_JSON**, or **GKLOUD\_KEYFILE\_JSON** environment variables
  - The `~/gcp/osServiceAccount.json` file
  - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For `<installation_directory>`, specify the location of your customized `./install-config.yaml` file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

#### NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

3. Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
  - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
  - If you included the **Service Account Key Admin** role, you can remove it.

### 7.7.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

- 5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 7.7.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 7.7.9. Disabling the default OperatorHub sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

#### Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
  -p [{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]
```

#### TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, delete, disable, and enable individual sources.

## 7.7.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 7.7.11. Next steps

- [Validate an installation.](#)
- [Customize your cluster.](#)
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#) .
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 7.8. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC

In OpenShift Container Platform version 4.9, you can install a cluster into an existing Virtual Private Cloud (VPC) on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 7.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#) .

### 7.8.2. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into existing subnets in an existing Virtual

Private Cloud (VPC) in Google Cloud Platform (GCP). By deploying OpenShift Container Platform into an existing GCP VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option. You must configure networking for the subnets.

### 7.8.2.1. Requirements for using your VPC

The union of the VPC CIDR block and the machine network CIDR must be non-empty. The subnets must be within the machine network.

The installation program does not create the following components:

- NAT gateways
- Subnets
- Route tables
- VPC network

#### NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

### 7.8.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide one subnet for control-plane machines and one subnet for compute machines.
- The subnet's CIDRs belong to the machine CIDR that you specified.

### 7.8.2.3. Division of permissions

Some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

### 7.8.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed to the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.

- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

### 7.8.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 7.8.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

5. Set the **GOOGLE\_APPLICATION\_CREDENTIALS** environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

6. Verify that the credentials were applied.

```
$ gcloud auth list
```

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 7.8.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 7.8.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Google Cloud Platform (GCP).

### Prerequisites

- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.
- Obtain service principal permissions at the subscription level.

### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **gcp** as the platform to target.
  - iii. If you have not configured the service account key for your GCP account on your computer, you must obtain it from GCP and paste the contents of the file or enter the absolute path to the file.
  - iv. Select the project ID to provision the cluster in. The default value is specified by the service account that you configured.
  - v. Select the region to deploy the cluster to.
  - vi. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
  - vii. Enter a descriptive name for your cluster.
  - viii. Paste the [pull secret from the Red Hat OpenShift Cluster Manager](#) .
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
  3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 7.8.6.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

### IMPORTANT

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

#### 7.8.6.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 7.25. Required parameters

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;</b> . <b>&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 7.8.6.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 7.26. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	Object <div style="display: flex; align-items: center; margin-top: 10px;">  <div> <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p> </div> </div>
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .

Parameter	Description	Values
<b>networking.clusterNetwork</b>	<p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	<p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>	<p>An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b>.</p>
<b>networking.clusterNetwork.hostPrefix</b>	<p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>
<b>networking.serviceNetwork</b>	<p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>
<b>networking.machineNetwork.cidr</b>	<p>Required if you use <b>networking.machineNetwork</b>. An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b>.</p>	<p>An IP network block in CIDR notation.</p> <p>For example, <b>10.0.0.0/16</b>.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>NOTE</b></p> <p>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.</p> </div> </div>

## 7.8.6.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 7.27. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>

Parameter	Description	Values
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div data-bbox="485 1093 592 1411" style="background-color: black; width: 67px; height: 142px; margin-bottom: 10px;"></div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported. If you are installing on GCP into a shared virtual private cloud (VPC), <b>credentialsMode</b> must be set to <b>Passthrough</b>.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start; gap: 10px;"> <div style="width: 60px; height: 150px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; gap: 10px; margin-top: 10px;"> <div style="width: 60px; height: 80px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px);"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 7.8.6.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 7.28. Additional GCP parameters

Parameter	Description	Values
<b>platform.gcp.network</b>	The name of the existing VPC that you want to deploy your cluster to.	String.
<b>platform.gcp.region</b>	The name of the GCP region that hosts your cluster.	Any valid region name, such as <b>us-central1</b> .
<b>platform.gcp.type</b>	The <a href="#">GCP machine type</a> .	The GCP machine type.
<b>platform.gcp.zones</b>	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid <a href="#">GCP availability zones</a> , such as <b>us-central1-a</b> , in a <a href="#">YAML sequence</a> .
<b>platform.gcp.controlPlaneSubnet</b>	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p><b>IMPORTANT</b></p> <p>The <b>licenses</b> parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the <a href="#">license API</a> , such as the license to enable <a href="#">nested virtualization</a> . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default <b>pd-ssd</b> or the <b>pd-standard</b> disk type. The control plane nodes must be the <b>pd-ssd</b> disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing</code>	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>controlPlane.platform.gcp.osDisk.encryptionKey.location</code>	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>controlPlane.platform.gcp.osDisk.encryptionKey.projectID</code>	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
<code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKey.keyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKey.location</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKey.projectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

### 7.8.6.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 7.29. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 7.8.6.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines. For more information, see "Minimum resource requirements for cluster installation".
- The name of the custom machine type must adhere to the following syntax:  
**custom-<number\_of\_cpus>-<amount\_of\_memory\_in\_mb>**

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

#### Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
```

```

gcp:
  type: custom-6-20480
  replicas: 3

```

#### 7.8.6.4. Sample customized install-config.yaml file for GCP

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
  - hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id

```

```

replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  gcp:
  projectID: openshift-production 11
  region: us-central1 12
  network: existing_vpc 13
  controlPlaneSubnet: control_plane_subnet 14
  computeSubnet: compute_subnet 15
pullSecret: '{"auths": ...}' 16
fips: false 17
sshKey: ssh-ed25519 AAAA... 18

```

**1 10 11 12 16** Required. The installation program prompts you for this value.

**2 6** If you do not provide these parameters and values, the installation program provides the default value.

**3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

**4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

**5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-<project\_number>@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".

**13** Specify the name of an existing VPC.

- 14 Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.
- 15 Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 7.8.6.5. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

#### Prerequisites

- You created the **install-config.yaml** and complete any modifications to it.

#### Procedure

Create an Ingress Controller with global access on a new GCP cluster.

1. Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation\_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- 1 For **<installation\_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

### Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

### Sample `clientAccess` configuration to Global

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global 1
          type: GCP
          scope: Internal 2
          type: LoadBalancerService
```

- 1** Set `gcp.clientAccess` to **Global**.
- 2** Global access is only available to Ingress Controllers using internal load balancers.

## 7.8.7. Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

### 7.8.7.1. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  ...
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 7.8.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Remove any existing GCP credentials that do not use the service account key for the GCP account that you configured for your cluster and that are stored in the following locations:
  - The **GOOGLE\_CREDENTIALS**, **GOOGLE\_CLOUD\_KEYFILE\_JSON**, or **GKLOUD\_KEYFILE\_JSON** environment variables
  - The `~/gcp/osServiceAccount.json` file
  - The **gcloud cli** default credentials
2. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s
```

### NOTE

The cluster access and credential information also outputs to **<installation\_directory>/openshift\_install.log** when an installation succeeds.

### IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

- Optional: You can reduce the number of permissions for the service account that you used to install the cluster.
  - If you assigned the **Owner** role to your service account, you can remove that role and replace it with the **Viewer** role.
  - If you included the **Service Account Key Admin** role, you can remove it.

### 7.8.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

## Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 7.8.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

## 7.8.11. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

## 7.8.12. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 7.9. INSTALLING A PRIVATE CLUSTER ON GCP

In OpenShift Container Platform version 4.9, you can install a private cluster into an existing VPC on Google Cloud Platform (GCP). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 7.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured a GCP project](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain IAM credentials](#).

### 7.9.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints.

A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

## IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
  - The API services for the cloud to which you provision.
  - The hosts on the network that you provision.
  - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

### 7.9.2.1. Private clusters in GCP

To create a private cluster on Google Cloud Platform (GCP), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for only internal traffic.

The cluster still requires access to internet to access the GCP APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public network load balancers, which support public ingress
- A public DNS zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private DNS zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

Because it is not possible to limit access to external load balancers based on source tags, the private cluster uses only internal load balancers to allow access to internal instances.

The internal load balancer relies on instance groups rather than the target pools that the network load balancers use. The installation program creates instance groups for each zone, even if there is no instance in that group.

- The cluster IP address is internal only.

- One forwarding rule manages both the Kubernetes API and machine config server ports.
- The backend service is comprised of each zone's instance group and, while it exists, the bootstrap instance group.
- The firewall uses a single rule that is based on only internal source ranges.

#### 7.9.2.1.1. Limitations

No health check for the Machine config server, `/healthz`, runs because of a difference in load balancer functionality. Two internal load balancers cannot share a single IP address, but two network load balancers can share a single external IP address. Instead, the health of an instance is determined entirely by the `/readyz` check on port 6443.

### 7.9.3. About using a custom VPC

In OpenShift Container Platform 4.9, you can deploy a cluster into an existing VPC in Google Cloud Platform (GCP). If you do, you must also use existing subnets within the VPC and routing rules.

By deploying OpenShift Container Platform into an existing GCP VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. This is a good option to use if you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself.

#### 7.9.3.1. Requirements for using your VPC

The installation program will no longer create the following components:

- VPC
- Subnets
- Cloud router
- Cloud NAT
- NAT IP addresses

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. The installation program cannot subdivide network ranges for the cluster to use, set route tables for the subnets, or set VPC options like DHCP, so you must do so before you install the cluster.

Your VPC and subnets must meet the following characteristics:

- The VPC must be in the same GCP project that you deploy the OpenShift Container Platform cluster to.
- To allow access to the internet from the control plane and compute machines, you must configure cloud NAT on the subnets to allow egress to it. These machines do not have a public address. Even if you do not require access to the internet, you must allow egress to the VPC network to obtain the installation program and images. Because multiple cloud NATs cannot be configured on the shared subnets, the installation program cannot configure it.

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist and belong to the VPC that you specified.
- The subnet CIDRs belong to the machine CIDR.
- You must provide a subnet to deploy the cluster control plane and compute machines to. You can use the same subnet for both machine types.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted.

### 7.9.3.2. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resources in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or Ingress rules.

The GCP credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as load balancers, security groups, storage, and nodes.

### 7.9.3.3. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is preserved by firewall rules that reference the machines in your cluster by the cluster's infrastructure ID. Only traffic within the cluster is allowed.

If you deploy multiple clusters to the same VPC, the following components might share access between clusters:

- The API, which is globally available with an external publishing strategy or available throughout the network in an internal publishing strategy
- Debugging tools, such as ports on VM instances that are open to the machine CIDR for SSH and ICMP access

### 7.9.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.9, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

**7.9.5. Generating a key pair for cluster node SSH access**

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

**Procedure**

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses FIPS Validated / Modules in Process cryptographic libraries on the **x86\_64** architecture, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

- View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

- Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- If the `ssh-agent` process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

- Add your SSH private key to the `ssh-agent`:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

- Set the `GOOGLE_APPLICATION_CREDENTIALS` environment variable to the full path to your service account private key file.

```
$ export GOOGLE_APPLICATION_CREDENTIALS="<your_service_account_file>"
```

- Verify that the credentials were applied.

```
$ gcloud auth list
```

## Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

## 7.9.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on a local computer.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program for your operating system, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from the Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

## 7.9.7. Manually creating the installation configuration file

For installations of a private OpenShift Container Platform cluster that are only accessible from an internal network and are not visible to the internet, you must manually generate your installation configuration file.

## Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

## Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

### IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation\_directory>**.

### NOTE

You must name this configuration file **install-config.yaml**.

### NOTE

For some platform types, you can alternatively run **./openshift-install create install-config --dir <installation\_directory>** to generate an **install-config.yaml** file. You can provide details about your cluster configuration at the prompts.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

### 7.9.7.1. Installation configuration parameters

Before you deploy an OpenShift Container Platform cluster, you provide parameter values to describe your account on the cloud platform that hosts your cluster and optionally customize your cluster's platform. When you create the **install-config.yaml** installation configuration file, you provide values for the required parameters through the command line. If you customize your cluster, you can modify the **install-config.yaml** file to provide more details about the platform.

**NOTE**

After installation, you cannot modify these parameters in the **install-config.yaml** file.

**IMPORTANT**

The **openshift-install** command does not validate field names for parameters. If an incorrect name is specified, the related file or object is not created, and no error is reported. Ensure that the field names for any parameters that are specified are correct.

**7.9.7.1.1. Required configuration parameters**

Required installation configuration parameters are described in the following table:

**Table 7.30. Required parameters**

Parameter	Description	Values
<b>apiVersion</b>	The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installer may also support older API versions.	String
<b>baseDomain</b>	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.	A fully-qualified domain or subdomain name, such as <b>example.com</b> .
<b>metadata</b>	Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.	Object
<b>metadata.name</b>	The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .	String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> .

Parameter	Description	Values
<b>platform</b>	The configuration for the specific platform upon which to perform the installation: <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>openstack</b> , <b>ovirt</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows.	Object
<b>pullSecret</b>	Get a <a href="#">pull secret from the Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	<pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre>

### 7.9.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

Table 7.31. Network parameters

Parameter	Description	Values
<b>networking</b>	The configuration for the cluster network.	<p>Object</p>  <p><b>NOTE</b></p> <p>You cannot modify parameters specified by the <b>networking</b> object after installation.</p>

Parameter	Description	Values
<b>networking.networkType</b>	The cluster network provider Container Network Interface (CNI) plugin to install.	Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI provider for all-Linux networks. <b>OVNKubernetes</b> is a CNI provider for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OpenShiftSDN</b> .
<b>networking.clusterNetwork</b>	The IP address blocks for pods.  The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b> .  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>
<b>networking.clusterNetwork.cidr</b>	Required if you use <b>networking.clusterNetwork</b> . An IP address block.  An IPv4 network.	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .
<b>networking.clusterNetwork.hostPrefix</b>	The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b> . A <b>hostPrefix</b> value of <b>23</b> provides 510 ( $2^{(32 - 23)} - 2$ ) pod IP addresses.	A subnet prefix.  The default value is <b>23</b> .
<b>networking.serviceNetwork</b>	The IP address block for services. The default value is <b>172.30.0.0/16</b> .  The OpenShift SDN and OVN-Kubernetes network providers support only a single IP address block for the service network.	An array with an IP address block in CIDR format. For example:  <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>
<b>networking.machineNetwork</b>	The IP address blocks for machines.  If you specify multiple IP address blocks, the blocks must not overlap.	An array of objects. For example:  <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
<b>networking.machineNetwork.cidr</b>	Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt. For libvirt, the default value is <b>192.168.126.0/24</b> .	An IP network block in CIDR notation. For example, <b>10.0.0.0/16</b> .  <b>NOTE</b> Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in.

### 7.9.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 7.32. Optional parameters

Parameter	Description	Values
<b>additionalTrustBundle</b>	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
<b>compute</b>	The configuration for the machines that comprise the compute nodes.	Array of <b>MachinePool</b> objects.
<b>compute.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>compute.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: flex-start;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>compute.name</b>	Required if you use <b>compute</b> . The name of the machine pool.	<b>worker</b>
<b>compute.platform</b>	Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere</b> , or <b>{}</b>
<b>compute.replicas</b>	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .
<b>controlPlane</b>	The configuration for the machines that comprise the control plane.	Array of <b>MachinePool</b> objects.
<b>controlPlane.architecture</b>	Determines the instruction set architecture of the machines in the pool. Currently, heterogeneous clusters are not supported, so all pools must specify the same architecture. Valid values are <b>amd64</b> (the default).	String

Parameter	Description	Values
<b>controlPlane.hyperthreading</b>	<p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div style="display: flex; align-items: center;">  <div> <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> </div>	<b>Enabled</b> or <b>Disabled</b>
<b>controlPlane.name</b>	Required if you use <b>controlPlane</b> . The name of the machine pool.	<b>master</b>
<b>controlPlane.platform</b>	Required if you use <b>controlPlane</b> . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the <b>compute.platform</b> parameter value.	<b>aws, azure, gcp, openstack, ovirt, vsphere, or {}</b>
<b>controlPlane.replicas</b>	The number of control plane machines to provision.	The only supported value is <b>3</b> , which is the default value.

Parameter	Description	Values
<b>credentialsMode</b>	<p>The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported. If you are installing on GCP into a shared virtual private cloud (VPC), <b>credentialsMode</b> must be set to <b>Passthrough</b>.</p> <p> <b>NOTE</b></p> <p>Not all CCO modes are supported for all cloud providers. For more information on CCO modes, see the <i>Cloud Credential Operator</i> entry in the <i>Cluster Operators reference</i> content.</p> <p> <b>NOTE</b></p> <p>If your AWS account has service control policies (SCP) enabled, you must configure the <b>credentialsMode</b> parameter to <b>Mint</b>, <b>Passthrough</b> or <b>Manual</b>.</p>	<b>Mint, Passthrough, Manual</b> or an empty string ("").

Parameter	Description	Values
<b>fips</b>	<p>Enable or disable FIPS mode. The default is <b>false</b> (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div style="display: flex; align-items: flex-start;"> <div style="width: 60px; height: 150px; background: repeating-linear-gradient(45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>IMPORTANT</b></p> <p>The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the <b>x86_64</b> architecture.</p> </div> </div> <div style="display: flex; align-items: flex-start; margin-top: 10px;"> <div style="width: 60px; height: 80px; background: repeating-linear-gradient(-45deg, transparent, transparent 2px, black 2px, black 4px); margin-right: 10px;"></div> <div> <p><b>NOTE</b></p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div> </div>	<b>false</b> or <b>true</b>
<b>imageContentSources</b>	Sources and repositories for the release-image content.	Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.
<b>imageContentSources.source</b>	Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.	String
<b>imageContentSources.mirrors</b>	Specify one or more repositories that may also contain the same images.	Array of strings
<b>publish</b>	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> .

Parameter	Description	Values
<b>sshKey</b>	<p>The SSH key or keys to authenticate access your cluster machines.</p>  <p><b>NOTE</b></p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</p>	<p>One or more keys. For example:</p> <pre>sshKey:   &lt;key1&gt;   &lt;key2&gt;   &lt;key3&gt;</pre>

#### 7.9.7.1.4. Additional Google Cloud Platform (GCP) configuration parameters

Additional GCP configuration parameters are described in the following table:

Table 7.33. Additional GCP parameters

Parameter	Description	Values
<b>platform.gcp.network</b>	The name of the existing VPC that you want to deploy your cluster to.	String.
<b>platform.gcp.region</b>	The name of the GCP region that hosts your cluster.	Any valid region name, such as <b>us-central1</b> .
<b>platform.gcp.type</b>	The <a href="#">GCP machine type</a> .	The GCP machine type.
<b>platform.gcp.zones</b>	The availability zones where the installation program creates machines for the specified MachinePool.	A list of valid <a href="#">GCP availability zones</a> , such as <b>us-central1-a</b> , in a <a href="#">YAML sequence</a> .
<b>platform.gcp.controlPlaneSubnet</b>	The name of the existing subnet in your VPC that you want to deploy your control plane machines to.	The subnet name.

Parameter	Description	Values
<code>platform.gcp.computeSubnet</code>	The name of the existing subnet in your VPC that you want to deploy your compute machines to.	The subnet name.
<code>platform.gcp.licenses</code>	<p>A list of license URLs that must be applied to the compute images.</p>  <p><b>IMPORTANT</b></p> <p>The <b>licenses</b> parameter is a deprecated field and nested virtualization is enabled by default. It is not recommended to use this field.</p>	Any license available with the <a href="#">license API</a> , such as the license to enable <a href="#">nested virtualization</a> . You cannot use this parameter with a mechanism that generates pre-built images. Using a license URL forces the installer to copy the source image before use.
<code>platform.gcp.osDiskSizeGB</code>	The size of the disk in gigabytes (GB).	Any size between 16 GB and 65536 GB.
<code>platform.gcp.osDiskType</code>	The type of disk.	Either the default <b>pd-ssd</b> or the <b>pd-standard</b> disk type. The control plane nodes must be the <b>pd-ssd</b> disk type. The worker nodes can be either type.
<code>controlPlane.platform.gcp.osDiskEncryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for control plane machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>controlPlane.platform.gcp.osDisk.encryptionKey.kmsKeyRing</code>	For control plane machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>controlPlane.platform.gcp.osDisk.encryptionKey.location</code>	For control plane machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>controlPlane.platform.gcp.osDisk.encryptionKey.projectID</code>	For control plane machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.
<code>compute.platform.gcp.osDisk.encryptionKey.kmsKeyName</code>	The name of the customer managed encryption key to be used for compute machine disk encryption.	The encryption key name.

Parameter	Description	Values
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyRing</code>	For compute machines, the name of the KMS key ring to which the KMS key belongs.	The KMS key ring name.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyLocation</code>	For compute machines, the GCP location in which the key ring exists. For more information on KMS locations, see Google's documentation on <a href="#">Cloud KMS locations</a> .	The GCP location for the key ring.
<code>compute.platform.gcp.ossDisk.encryptionKey.kmsKeyProjectID</code>	For compute machines, the ID of the project in which the KMS key ring exists. This value defaults to the VM project ID if not set.	The GCP project ID.

### 7.9.7.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 7.34. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	IOPS [2]
Compute	RHCOS, RHEL 7.9, or RHEL 8.4 [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or hyperthreading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and planned for removal in a future release of OpenShift Container Platform 4.

### 7.9.7.3. Using custom machine types

Using a custom machine type to install a OpenShift Container Platform cluster is supported.

Consider the following when using a custom machine type:

- Similar to predefined instance types, custom machine types must meet the minimum resource requirements for control plane and compute machines. For more information, see "Minimum resource requirements for cluster installation".
- The name of the custom machine type must adhere to the following syntax:  
**custom-<number\_of\_cpus>-<amount\_of\_memory\_in\_mb>**

For example, **custom-6-20480**.

As part of the installation process, you specify the custom machine type in the **install-config.yaml** file.

#### Sample install-config.yaml file with a custom machine type

```
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform:
    gcp:
      type: custom-6-20480
  replicas: 2
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform:
```

```

gcp:
  type: custom-6-20480
  replicas: 3

```

#### 7.9.7.4. Sample customized install-config.yaml file for GCP

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
controlPlane: 2 3
  hyperthreading: Enabled 4
  name: master
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-ssd
      diskSizeGB: 1024
      encryptionKey: 5
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id
  replicas: 3
compute: 6 7
  - hyperthreading: Enabled 8
  name: worker
  platform:
    gcp:
      type: n2-standard-4
      zones:
      - us-central1-a
      - us-central1-c
    osDisk:
      diskType: pd-standard
      diskSizeGB: 128
      encryptionKey: 9
      kmsKey:
        name: worker-key
        keyRing: test-machine-keys
        location: global
        projectID: project-id

```

```

replicas: 3
metadata:
  name: test-cluster 10
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OpenShiftSDN
  serviceNetwork:
  - 172.30.0.0/16
platform:
  gcp:
    projectID: openshift-production 11
    region: us-central1 12
    network: existing_vpc 13
    controlPlaneSubnet: control_plane_subnet 14
    computeSubnet: compute_subnet 15
  pullSecret: '{"auths": ...}' 16
  fips: false 17
  sshKey: ssh-ed25519 AAAA... 18
  publish: Internal 19

```

- 1 10 11 12 16** Required. The installation program prompts you for this value.
- 2 6** If you do not provide these parameters and values, the installation program provides the default value.
- 3 7** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 4 8** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger machine types, such as **n1-standard-8**, for your machines if you disable simultaneous multithreading.

- 5 9** Optional: The custom encryption key section to encrypt both virtual machines and persistent volumes. Your default compute service account must have the permissions granted to use your KMS key and have the correct IAM role assigned. The default service account name follows the **service-`<project_number>`@compute-system.iam.gserviceaccount.com** pattern. For more information on granting the correct permissions for your service account, see "Machine management" → "Creating machine sets" → "Creating a machine set on GCP".
- 13** Specify the name of an existing VPC.

- 14 Specify the name of the existing subnet to deploy the control plane machines to. The subnet must belong to the VPC that you specified.
- 15 Specify the name of the existing subnet to deploy the compute machines to. The subnet must belong to the VPC that you specified.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

The use of FIPS Validated / Modules in Process cryptographic libraries is only supported on OpenShift Container Platform deployments on the **x86\_64** architecture.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 19 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

#### 7.9.7.5. Create an Ingress Controller with global access on GCP

You can create an Ingress Controller that has global access to a Google Cloud Platform (GCP) cluster. Global access is only available to Ingress Controllers using internal load balancers.

#### Prerequisites

- You created the **install-config.yaml** and complete any modifications to it.

#### Procedure

Create an Ingress Controller with global access on a new GCP cluster.

1. Change to the directory that contains the installation program and create a manifest file:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation\_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- 1 For **<installation\_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

### Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

### Sample **clientAccess** configuration to **Global**

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      providerParameters:
        gcp:
          clientAccess: Global 1
          type: GCP
          scope: Internal 2
          type: LoadBalancerService
```

- 1 Set **gcp.clientAccess** to **Global**.
- 2 Global access is only available to Ingress Controllers using internal load balancers.

## 7.9.8. Additional resources

- [Enabling customer-managed encryption keys for a machine set](#)

### 7.9.8.1. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to

hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
...

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace to hold the additional CA certificates. If you provide **additionalTrustBundle** and at least one proxy setting, the **Proxy** object is configured to reference the **user-ca-bundle** config map in the **trustedCA** field. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges the contents specified for the **trustedCA** parameter with the RHCOS trust bundle. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

#### NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 7.9.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- Configure an account with the cloud platform that hosts your cluster.
- Obtain the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

**1** For **<installation\_directory>**, specify the

**2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

If the cloud provider account that you configured on your host does not have sufficient permissions to deploy the cluster, the installation process stops, and the missing permissions are displayed.

When the cluster deployment completes, directions for accessing your cluster, including a link to its web console and credentials for the **kubeadmin** user, display in your terminal.

#### Example output

```
...
INFO Install complete!
```

```

INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "4vYBz-Ee6gm-ymBZj-
Wt5AL"
INFO Time elapsed: 36m22s

```

## NOTE

The cluster access and credential information also outputs to `<installation_directory>/openshift_install.log` when an installation succeeds.

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

## IMPORTANT

You must not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### 7.9.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.9. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.

3. Click **Download Now** next to the **OpenShift v4.9 Linux Client** entry and save the file.
4. Unpack the archive:

```
$ tar xvf <file>
```

5. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version in the **Version** drop-down menu.
3. Click **Download Now** next to the **OpenShift v4.9 MacOSX Client** entry and save the file.
4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your **PATH**.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### 7.9.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 7.9.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.9, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 7.9.13. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 7.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES

In OpenShift Container Platform version 4.9, you can install a cluster on Google Cloud Platform (GCP) that uses infrastructure that you provide.
