Abstract

Once JBoss Operations Network is installed, you are ready to set up your inventory. The inventory in JBoss ON lists all of the recognized platforms, servers, and services

Table of Contents

1. MANAGING JBOSS PRODUCTS WITH JBOSS ON	2
2. DEPLOYING APPLICATIONS ON JBOSS INSTANCES	2

1. MANAGING JBOSS PRODUCTS WITH JBOSS ON

JBoss Operations Network provides extra tools that help manage JBoss server instances. These management tools cover everything from manually configuring a JBoss inventory to applying JBoss patches.

2. DEPLOYING APPLICATIONS ON JBOSS INSTANCES

A number of different types of services can be deployed on a JBoss instance by adding it as a child of that instance. JBoss ON provides additional guidance and options in the UI to simplify the process for deploying EARs, WARs, data sources, connection factories, and JMS queues.

2.1. Deploying EAR and WAR Files

1. Search for the JBoss server instance to which to deploy the EAR or WAR.
2. On the details page for the selected JBoss server instance, open the **Inventory** tab.
3. In the **Create New** drop-down menu, select the item for- **Web Application (WAR)** or - **Enterprise Application (EAR)**, as appropriate.
4. In the resource form, enter the information for the application to be deployed. Aside from the obvious settings, like the resource name, the WAR or EAR resource entry requires the following information:
 - The package name that the EAR or WAR file will be deployed as. In other words, the target entry name.
 - The package architecture.

NOTE

For EAR and WAR deployment, the package architecture should always be **noarch**.

- The full path to the file to be deployed, in the **File** field.
- Whether the file should be unzipped when it is deployed.
- The path to the directory to which to deploy the EAR or WAR package. The destination directory is relative to the JBoss server instance installation directory; this cannot contain an absolute path or go up a parent directory.

2.2. Deploying Data Sources

1. Search for the JBoss server instance to which to deploy the data source.
2. On the details page for the selected JBoss server instance, open the **Inventory** tab.

3. In the **Create New** drop-down menu, select the item for- **Data Sources**.
4. Select a template for the data source. There are three data sources templates to populate a data source with common information:
 - The default template is used with SQL databases like PostgreSQL or MySQL
 - The Oracle Local TX is used for Oracle databases with local transactions.
 - The Oracle XA template is used for Oracle databases with XA transactions.
5. Along with the obvious settings, like the resource name, enter the information for the specific child resource to be deployed:
 - The type of data source to create, either No TX Data Sources, Local TX Data Sources or XA Data Sources
 - A unique JNDI name for the DataSource wrapper to use to bind under
 - The fully qualified name of the JDBC driver or DataSource class, such as **org.postgresql.Driver**
 - The JDBC driver connection URL string, such as **jdbc:postgresql://127.0.0.1:5432/foo**
 - The username and password to use to connect to the data source
 - The minimum and maximum connection pool sizes for this data source

Additional settings are available under the **Advanced Settings** area. These are the same as the advanced settings available when the JBoss ON server is installed.

2.3. Deploying Connection Factories

1. Search for the JBoss server instance to which to deploy the connection factory.
2. On the details page for the selected JBoss server instance, open the **Inventory** tab.
3. In the **Create New** drop-down menu, select the item for- **Connection Factory**.
4. Along with the obvious settings, like the resource name, enter the information for the specific child resource to be deployed:
 - The type of connection factory to create, either tx-connection-factory (transaction) or no-tx-connection-factory (no transaction)
 - A unique JNDI name for the DataSource wrapper to use to bind under
 - The username and password to use to connect to the data source
 - The minimum and maximum connection pool sizes for this data source

Additional settings are available under the **Advanced Settings** area. These are the same as the advanced settings available when the JBoss ON server is installed.

2.4. Configuring JMS Queues and Topics

JMS Queues and JMS Topics are child resources of a JBossMQ service or JBossMessaging service resource, which itself is a child of a JBoss server instance.

1. Search for the JBoss messaging service to which to deploy the JMS queue or topic.
2. On the details page for the selected JBoss messaging service, open the **Inventory** tab.
3. In the **Create New** drop-down menu, select the item for- **JMQ JMS Topic** or - **JMQ JMS Queue**, as appropriate.
4. Aside from the obvious settings, like the resource name, the JMS Queue or JMS Topic entry requires two additional parameters:
 - The name of the queue or topic to use as the JMX object name
 - A unique JNDI name for the DataSource wrapper to use to bind under

Additional settings are available under the **Advanced Settings** area. These are the same as the advanced settings available when the JBoss ON server is installed.

2.5. Updating and Deleting Applications on JBoss Servers

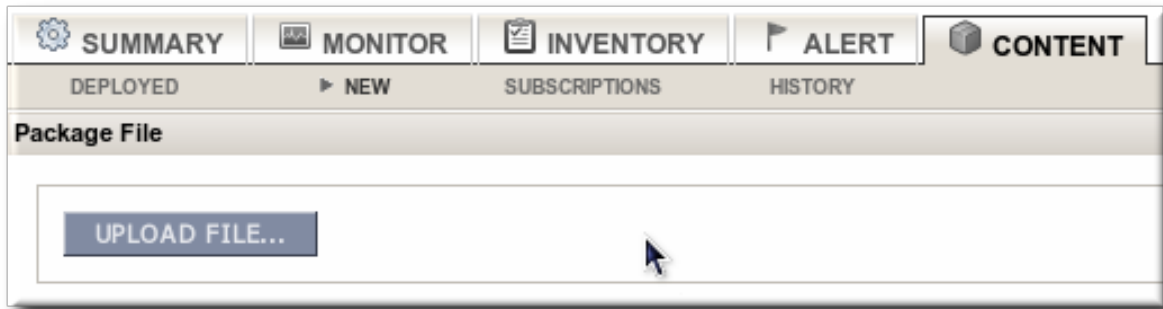

EARs and WARs can both be updated on JBoss server instances simply by uploading the updated packages.

1. Browse to the EAR or WAR resource in the JBoss ON UI.
2. In the EAR or WAR resource details page, open the **Content** tab, and click the **New** subtab.

The screenshot shows the JBoss ON UI for a resource named 'hellothere.war' located at 'localhost/hellothere'. The resource is a 'Web Application (WAR) (Service)' with a description 'Web Application (localhost/hellothere)' and a parent 'JBossAS Server '0.0.0.0:2099''. The 'CONTENT' tab is selected, and the 'NEW' subtab is highlighted. Below the tabs, there is a section for 'Packages Eligible for Deployment' with a table of columns: Package Name, Version, Type, Architecture, and Description. A 'DEPLOY SELECTED' button is present, and the total count is 'Total: 0'. At the bottom, there is an 'Upload New Package' section with a description and a highlighted 'UPLOAD NEW PACKAGE' button.

3. Click the **UPLOAD NEW PACKAGE** button.

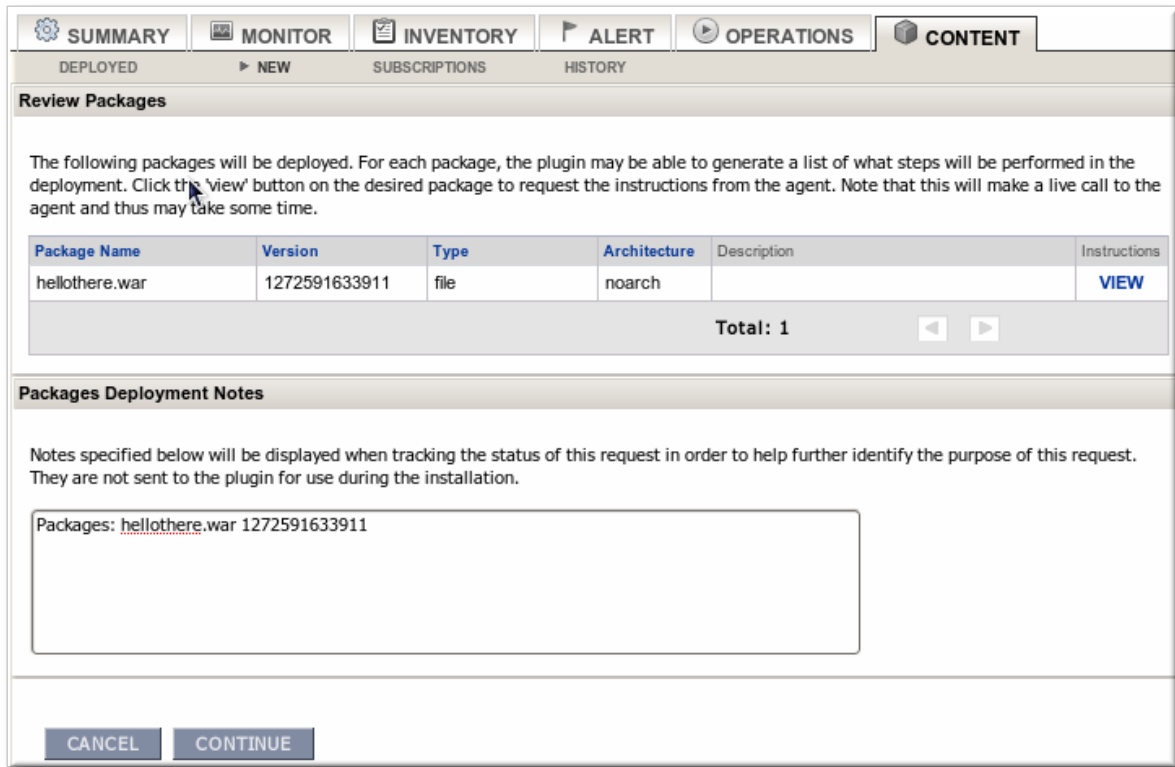

4. Click the **UPLOAD FILE** button.

5. In the pop-up window, click the **Add** button, and browse the local filesystem to the updated WAR or EAR file to be uploaded.

6. Click the **UPLOAD** button to load the file and dismiss the window.
7. In the main form, select the repository where the WAR or EAR file package should be stored. If one exists, select an existing repository or a subscribed repository for the resource. Otherwise, create a new repository.
8. Confirm the details for the new package, then click **CONTINUE**.

When the package is successfully uploaded, the UI redirects to the history page on the **Content** tab.

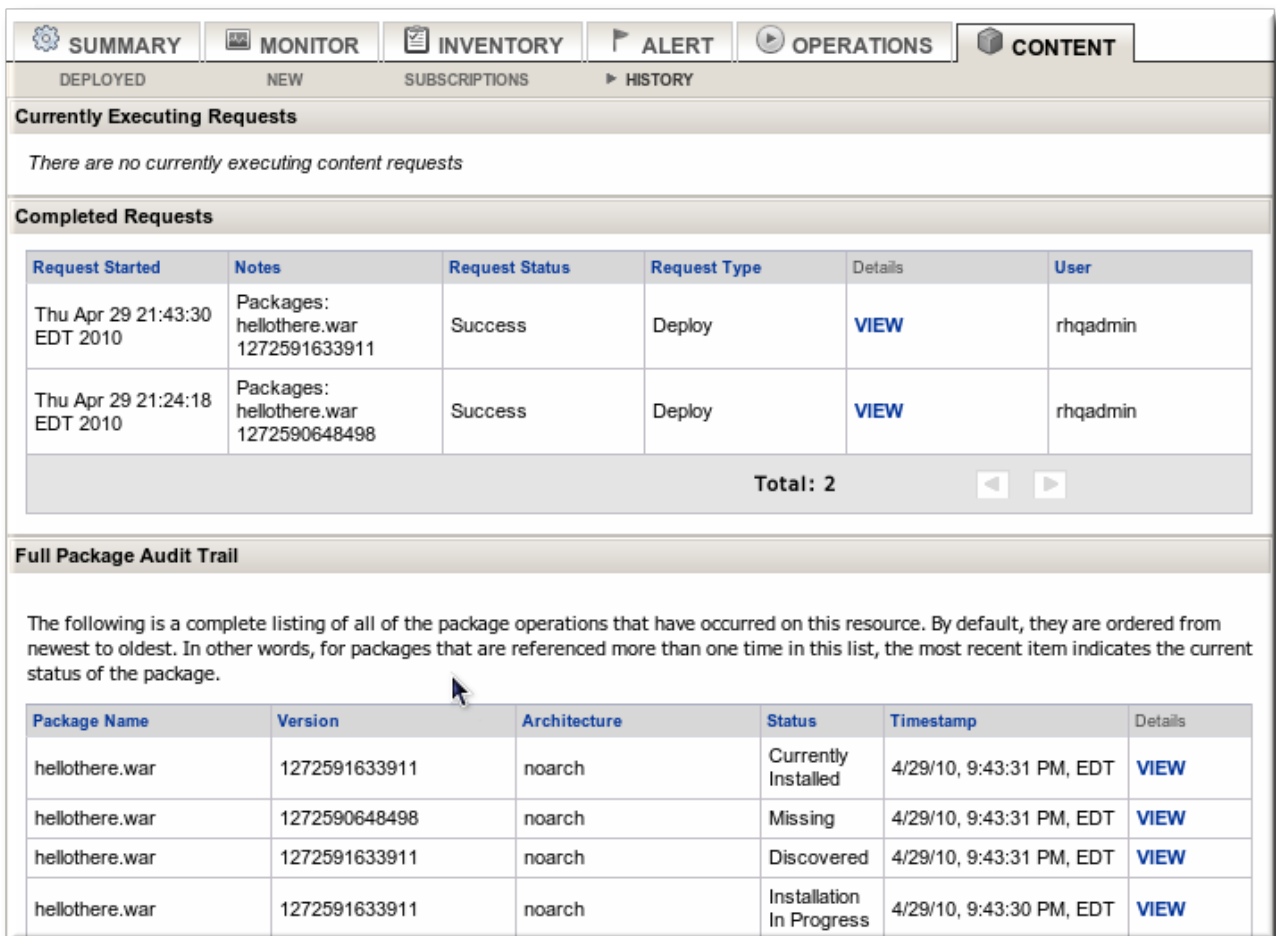

Figure 1. Deployment History for a Resource

**NOTE**

To undeploy an EAR or WAR, simply delete the EAR or WAR child resource.

3. APPLYING JBOSS PATCHES

Content management can be used to apply cumulative patches to JBoss Enterprise Application Platform 4. By default, the JBoss ON server comes pre-configured with the JBoss Patch Content Source and JBoss Patch Repository.

A *content source* connects a JBoss ON server to all the JBoss patches. A *repository* maps a content source to the resources in the inventory that the patches are applied to. For JBoss patches, the default content provider connects the JBoss ON server to the cumulative patches provided by the JBoss Customer Service Portal. The default repository associated with the content provider is where the metadata about the patches and the patches themselves are stored within JBoss ON.

The patch process updates existing JAR and class files with upgraded JAR and class files that are contained in the patch package. Other changes that need to be completed manually (all the "Not Performed" steps, for example) are also listed. If the configuration does not include one of the JAR files to be patched, then that step is skipped.

The patching process does not care what the server configuration profile is called or which base configuration it is derived from.

The JBoss ON agent is the entity which actually executes the patching process on a resource. The agent is informed of updates, pulls the information from the server, and then updates the local JAR and class files within the managed JBoss instance. The patching process runs independently of any server configuration profile or base configuration.

3.1. Supported JBoss Products for Patch Updates

JBoss Enterprise Application Platform 4 can receive and apply patch updates through the JBoss CSP feed in JBoss ON.

**NOTE**

Patch updates using the Patch RSS Feed is not supported for JBoss Enterprise Application Platform 5 or newer.

**NOTE**

A CSP feed is only available for a product or a specific version of a product if there is a patch in the CSP for that product. JBoss ON depends on the JBoss CSP to provide patch information.

3.2. Situations That Can Require Manual Steps

Some patches require additional, manual changes, such as editing an XML configuration file. Any required manual changes are listed as *special steps* in the patch installation summary. There are several different situations that require manual intervention:

- The file to be patched is not present in the configuration.

- There are files that need to be removed manually.
- Configuration files, such as XML or Java properties files, require patches that need to be applied manually.
- Seam is being used and must be patched manually.

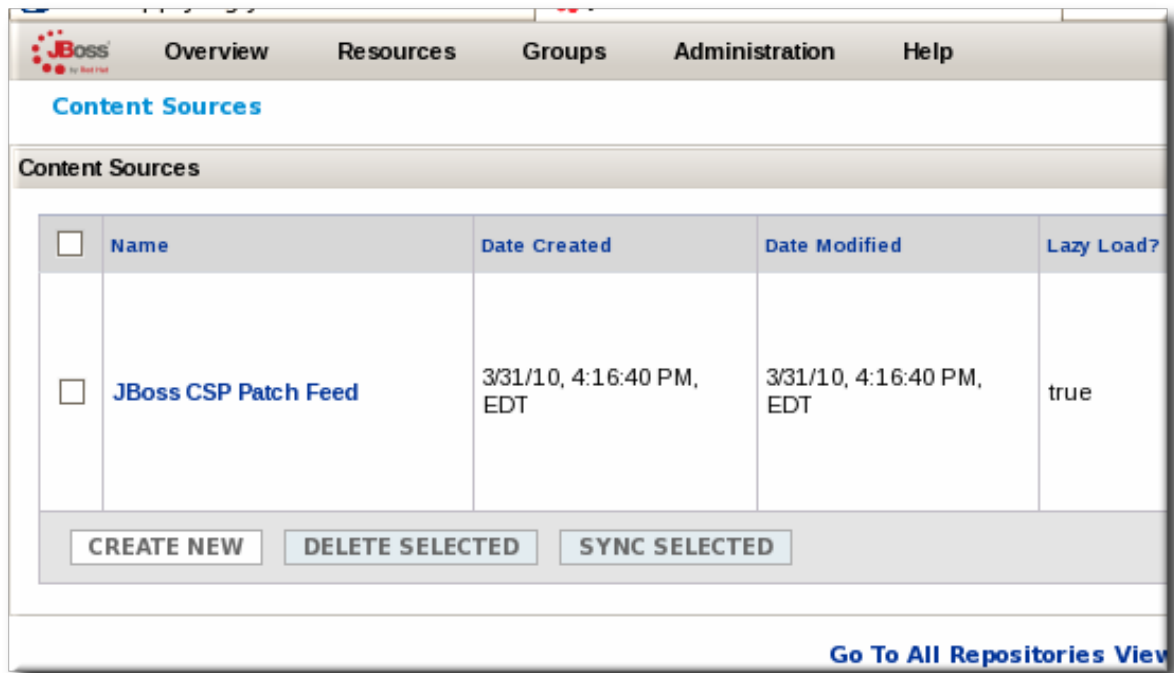

3.3. Enabling the Default JBoss Patch Content Source

NOTE

Perform patch installations during off hours or scheduled maintenance periods.

1. In the **Administration** tab in the top menu, open the **Content** menu and select the **Content Sources** item.
2. Click the **JBoss CSP Patch Feed** source.

3. Click the **Edit** button at the bottom of the **CSP Feed Settings** area to modify the content source.
4. Fill in the required connection information.

Content Sources > JBoss CSP Patch Feed

Basic Details

Type: JBossASPatchSource

Name: JBoss CSP Patch Feed

Description: an RSS feed published by the JBoss Customer Service Portal (CSP) website which provides a list of all JBoss

Synchronization Schedule: 0 0 0 1 * ?

Lazy Load:

Download Mode: DATABASE

Creation Date: 3/31/10, 4:16:40 PM, EDT

Last Modified Date: 3/31/10, 4:16:40 PM, EDT

Last Download Error: None

* denotes a required field.

CSP Feed Settings ⌵ Collapse

Name	Unset	Value	Description
Feed URL *		https://access.redhat.com/jbossnetwork/restricted/feed/software	URL of the RSS feed.
Username	<input type="checkbox"/>	jsmith	Username used to log into the CSP.
Password	<input type="checkbox"/>	*****	Password used to log into the CSP.
Active *		<input checked="" type="radio"/> Yes <input type="radio"/> No	Indicates if this instance should go out and check the feed for packages.

Proxy Settings ⌵ Expand

SAVE CANCEL

- The Customer Support Portal username and password
- The URL for the content source (<https://access.redhat.com/jbossnetwork/restricted/feed/software.html?product=all&downloadType=all&flavor=rss&version=&jonVersion=2.0>)
- The activation state (Yes)

Most of the default settings, such as the schedule, can be kept.

IMPORTANT

Keep the **Lazy Load** checkbox activated, or all patches defined in the RSS feed, 1 GB of data, is preemptively downloaded by the JBoss ON server.

5. Click **Save**.
6. Optionally, use **Synchronize** button to force the content source to pull down the latest RSS Feed and synchronize it with the local data. The history of synchronization attempts is listed in the **Synchronization Results** section.

3.4. Subscribing a Specific Resource to the Default JBoss Patch Repository

1. In the **Resources** item in the top menu, go to the **Servers** item.

2. Search for the JBoss instance to subscribe to the repository.
3. On the JBoss server resource's entry page, open the **Content** tab and select the **Subscriptions** subtab. The JBoss patches repository is listed as available for subscription.

127.0.0.1:1099
localhost.localdomain > 127.0.0.1:1099

<input type="checkbox"/>	JBoss Patches	the patches obtained from the JBoss CSP patch feed	0	3/31/10, 4:16:40 PM, EDT	7/1/10, 9:23:47 AM, EDT
Total: 1					

3.5. Subscribing Multiple JBoss Resources to the Default JBoss Patch Repository

The repository is associated with a content source (the patches that can be applied) and resources are then subscribed to this repository (where the patches can be applied to).

1. In the **Administration** tab in the top menu, open the **Content** menu and select the **Repositories** item.
2. Click the **JBoss Patch Channel**.

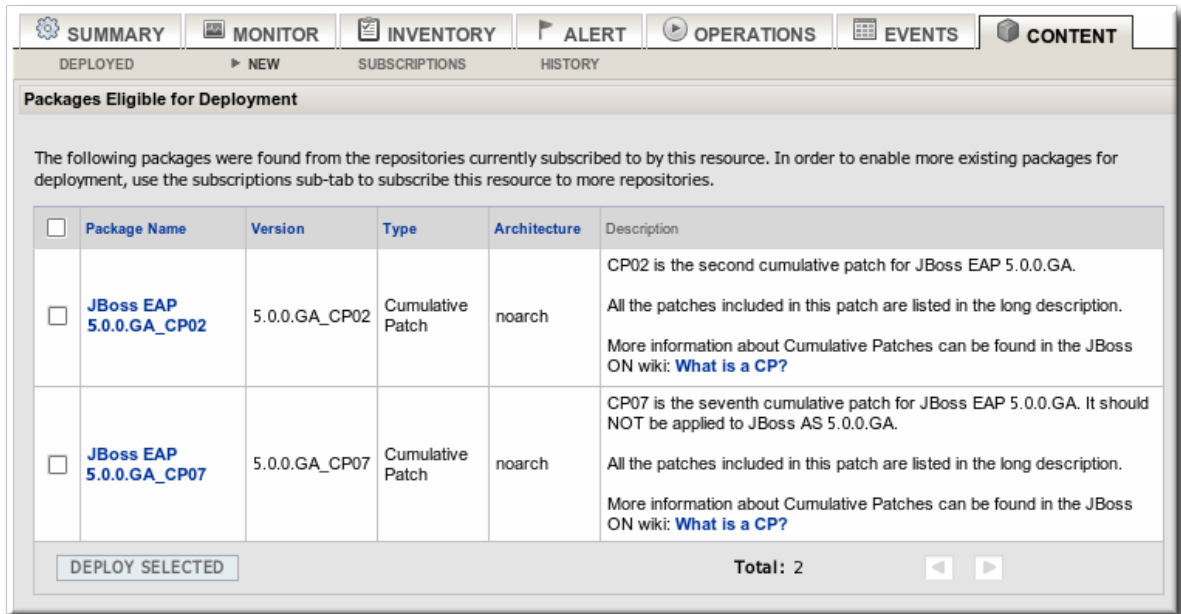

The JBoss patch repository is associated with the JBoss patch content source by default. To associate the repository to another content source, click the **ASSOCIATE...** button and assign the content source.

3. In the main page for the repository, click the **SUBSCRIBE...** button to subscribe JBoss resources to the patch repository.
4. In the search area, select **Server** in the drop-down menu.
5. Select all the JBoss server instance resources to subscribe to this repository.

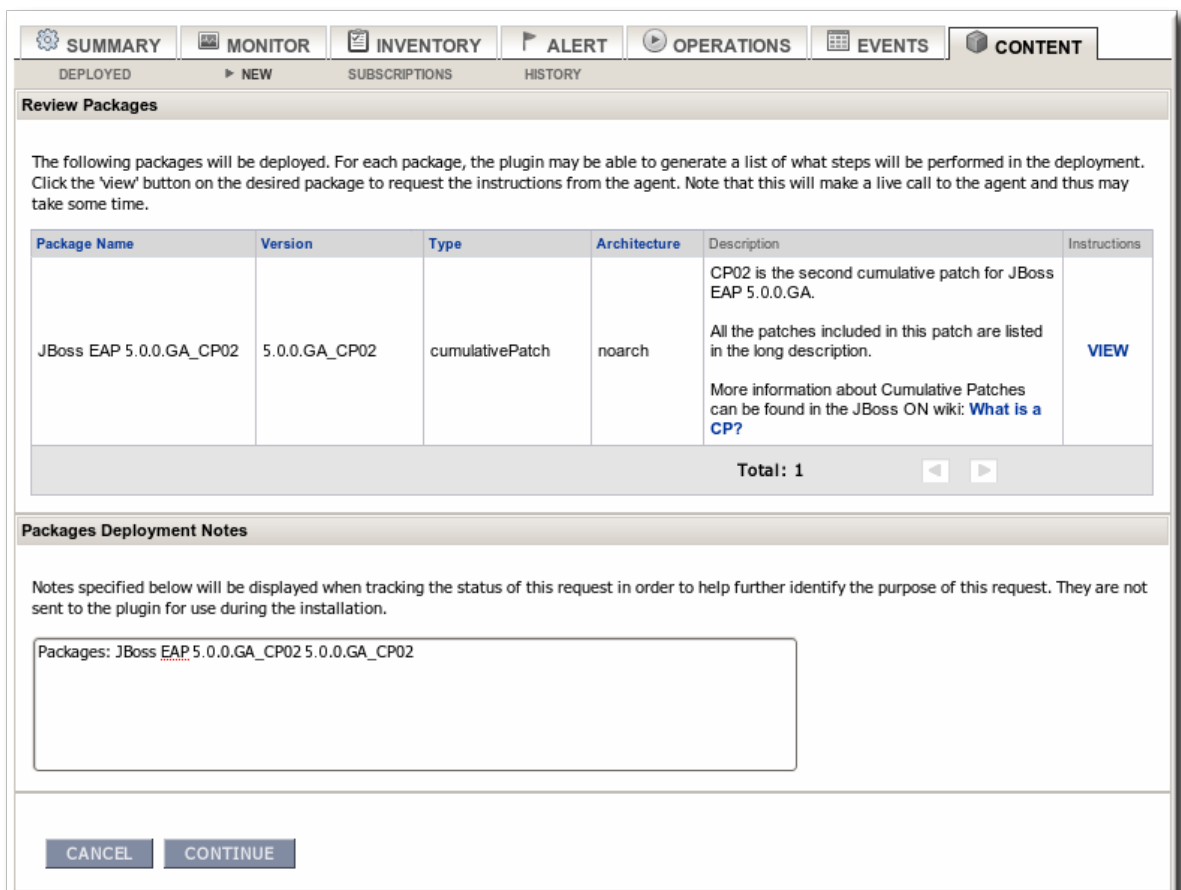

3.6. Applying a Patch

For patches to be applied to a JBoss server, the server must first be subscribed to the JBoss content repository.

1. Stop the JBoss instance.
2. In the **Resources** item in the top menu, go to the **Servers** item.
3. Search for the JBoss instance to patch.
4. On the JBoss server resource's entry page, open the **Content** tab and select the **New** subtab. This lists all of the packages and patches which are available for that specific resource type.
5. Select the checkboxes beside the names of the patched to install, and click the **DEPLOY SELECTED** button.

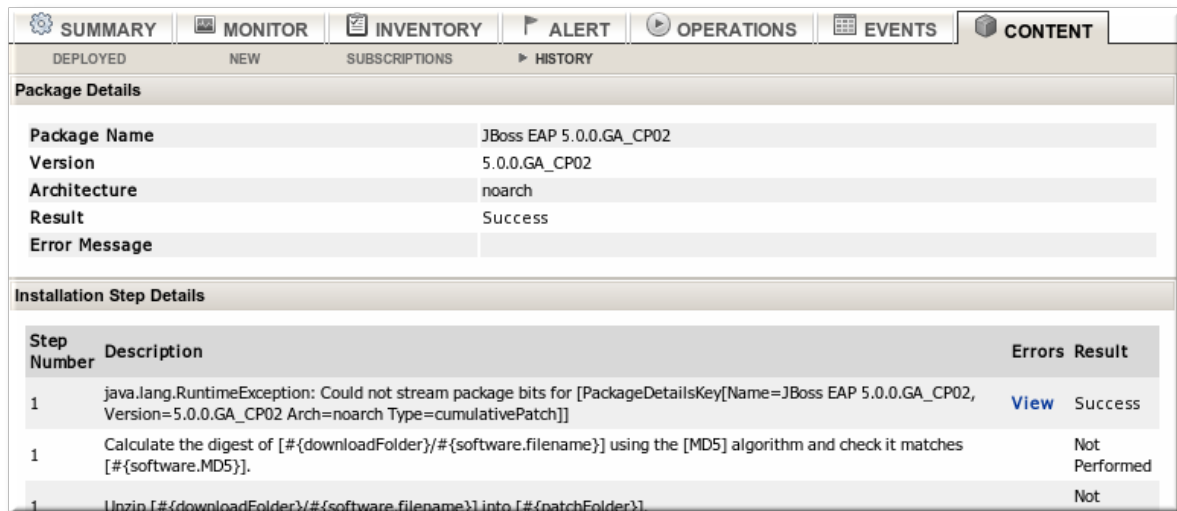

- Review the information on the page and verify everything is correct. Click the **VIEW** link in the **Instructions** column to review the steps that will be performed during the package installation process.

- Optionally, enter any notes to describe the patch deployment or environment.
- Click the **CONTINUE** button to install the updates. The patch process runs in the background; the progress can be viewed in the **History** subtab of the **Content** tab.

9. When the installation process is complete, the patch job is listed in the **Completed Requests** area. Clicking the **VIEW** button displays the list of steps that performed in the process and whether they succeeded, failed, or were skipped.

Step Number	Description	Errors	Result
1	java.lang.RuntimeException: Could not stream package bits for [PackageDetailsKey{Name=JBoss EAP 5.0.0.GA_CP02, Version=5.0.0.GA_CP02 Arch=noarch Type=cumulativePatch}]	View	Success
1	Calculate the digest of [#{downloadFolder}/#{software.filename}] using the [MD5] algorithm and check it matches [#{software.MD5}].		Not Performed
1	Unzip [#{downloadFolder}/#{software.filename}] into [#{patchFolder}].		Not

10. When the patch process is complete, start the JBoss instance.

4. MANAGING MOD_CLUSTER DEPLOYMENTS

The **mod_cluster** module provides intelligent, dynamic load balancing for web applications. There are two halves to **mod_cluster**: one in the JBoss application server (which manages the web application contexts) and one in the HTTP server (which manages sessions and routing). JBoss ON monitors and manages the **mod_cluster** module within the JBoss server.

NOTE

JBoss ON supports **mod_cluster** version 1.1.2. This version of **mod_cluster** is not currently supported on JBoss EAP or the **httpd** service on Red Hat Enterprise Linux.

4.1. About mod_cluster

mod_cluster is an HTTP load balancer that provides a level of intelligence and control over web applications that is not available with other HTTP load balancers. **mod_cluster** has lots of features that improve performance and management, but two are crucial:

- By using multicast (*advertising*), **mod_cluster** signals workers what proxy servers are available, so workers can register themselves dynamically with the cluster domain.
- Using a special communication layer between the JBoss server and the HTTP server, **mod_cluster** can not only register when a web context is enabled but also when it is disabled and removed from load balancing. This allows **mod_cluster** to handle full web application life cycles.

More detail about the features of **mod_cluster** is in the product documentation at http://www.jboss.org/mod_cluster.

mod_cluster has two modules: one for the HTTP server which handles routing and load balancing and one for the JBoss server to manage the web application contexts. Both modules must be installed and configured for the cluster to function.

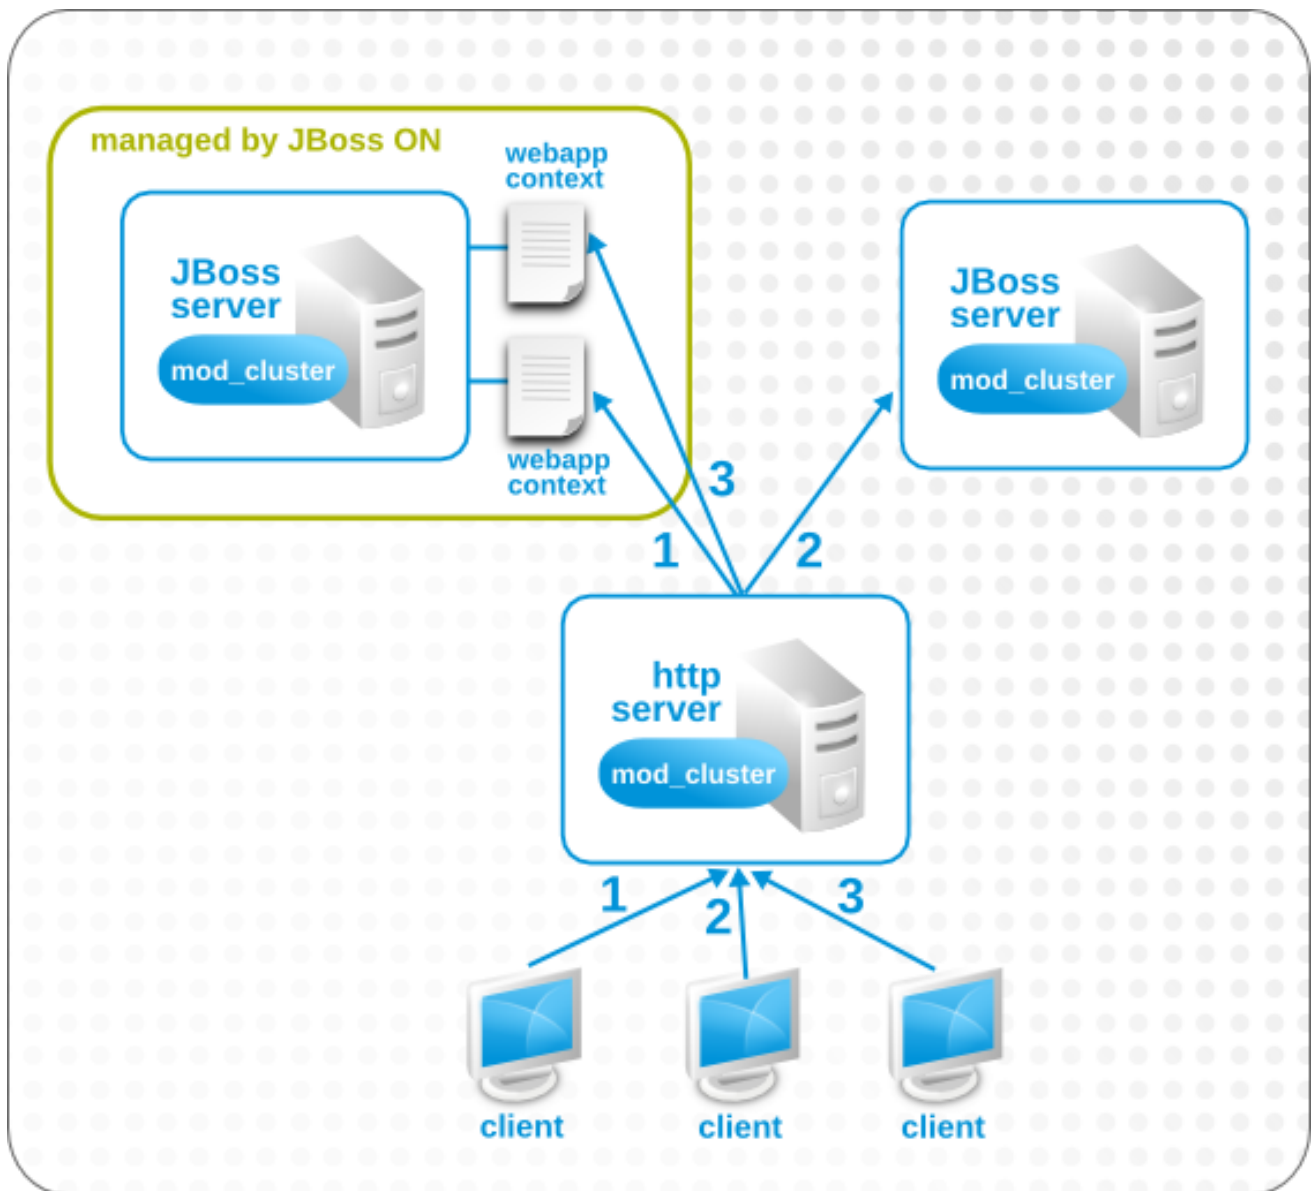

Figure 2. The mod_cluster Topology

In JBoss ON, the entire **mod_cluster** domain is imported as a child resource for the JBoss server. The web application contexts are listed as children resources for the cluster, with contexts as children within the **mod_cluster** module.

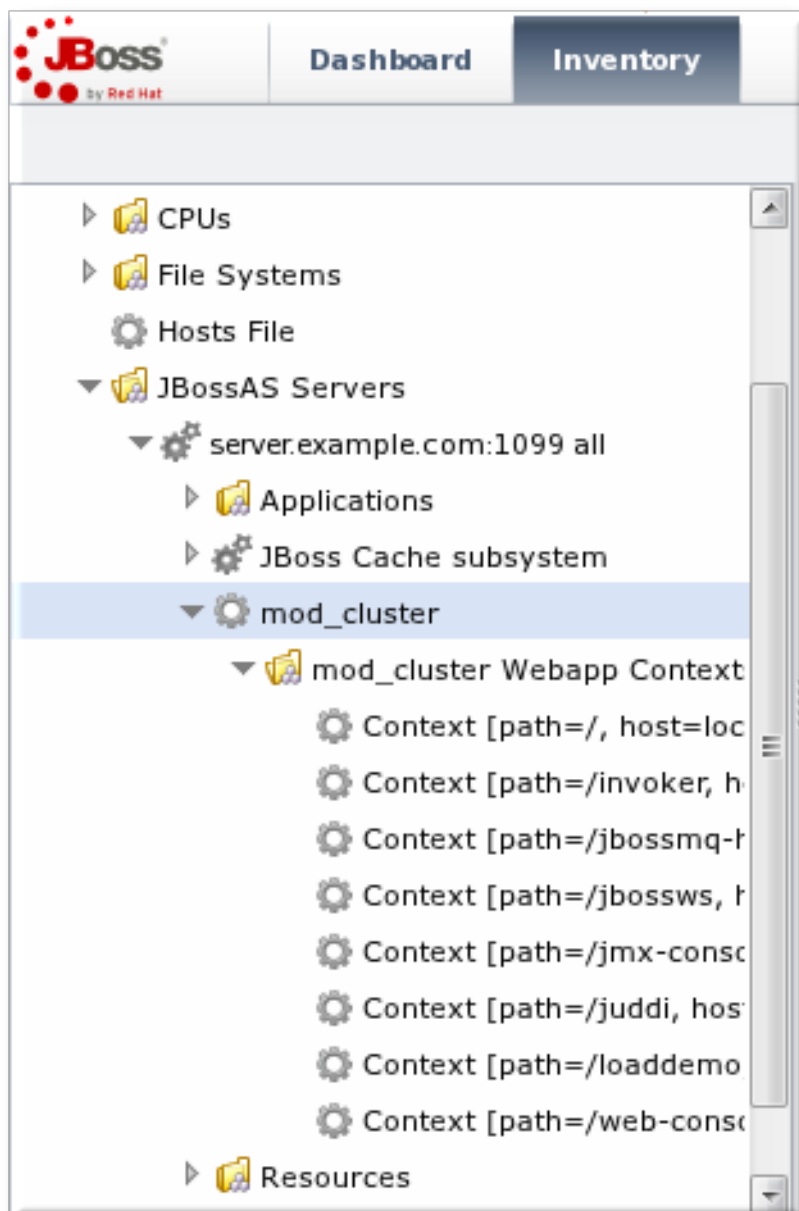

Figure 3. The mod_cluster Resource Hierarchy

IMPORTANT

The **mod_cluster** module in the HTTP server is configured externally from JBoss ON and is not managed by JBoss ON.

The **mod_cluster** module in the JBoss server can be managed by JBoss ON, and it is critical that the cluster is properly configured in order for JBoss ON to manage its resources. JBoss ON detects **mod_cluster** like any other JMX resource (such as Hibernate).

There are a number of resources available for installing and configuring **mod_cluster**:

- http://docs.jboss.org/mod_cluster/1.1.0/html/
- https://access.redhat.com/documentation/en-US/JBoss_Enterprise_Application_Platform/5/html/HTTP_Connectors_Load_Balancing/

4.2. Managing mod_cluster

The **mod_cluster** properties provide direct management over how the **mod_cluster** domain operates. Almost any part of the **mod_cluster** configuration can be managed through JBoss ON, but two elements are critical for domain behavior:

- How the **mod_cluster** domain handles sticky sessions. Sticky sessions are enabled in **mod_cluster** by default, but this can be disabled or its behavior can be changed through the configuration properties.
- Enabling advertising (multicast). **mod_cluster** can send the JBoss information to any VirtualHost configured in the HTTP server. This allows workers to find the cluster and register themselves with the JBoss server dynamically.

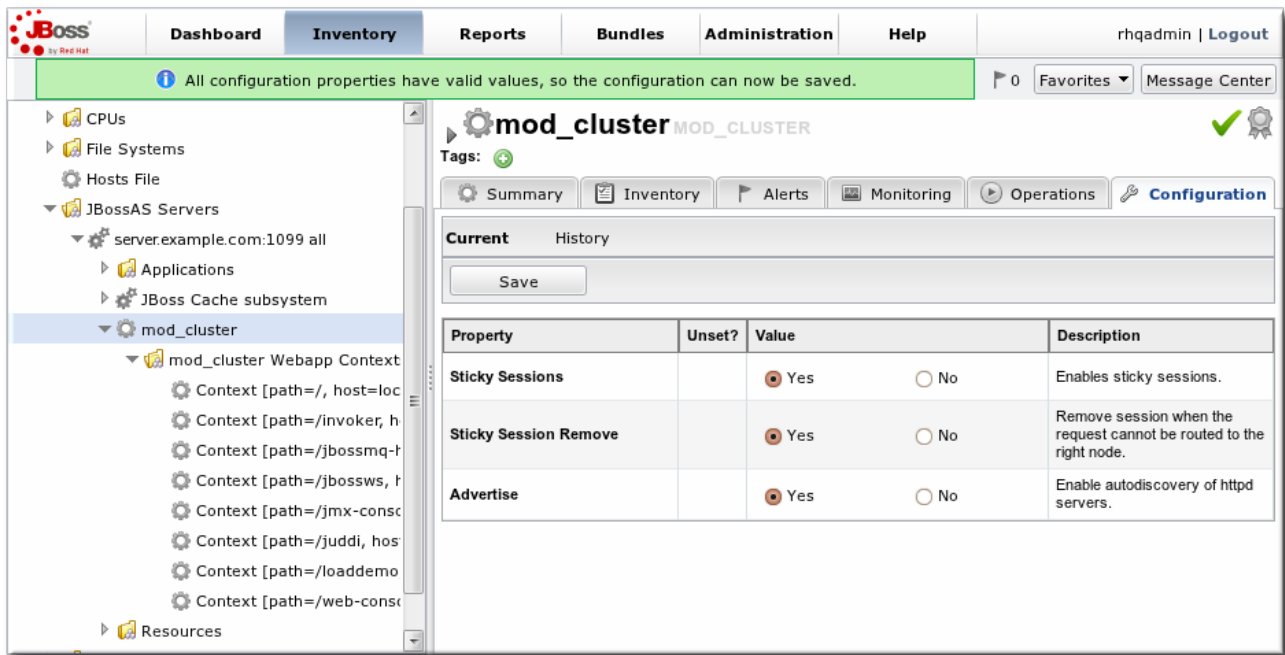

Figure 4. Setting Server-Level Properties

The server-level operations apply to all web application contexts configured within the **mod_cluster** domain domain. The obvious ones that impact the web application contexts are enabling and disabling all contexts. The other options are used to reset the **mod_cluster** domain after an error (reset the node) or reload the cluster configuration after making changes to the cluster properties.

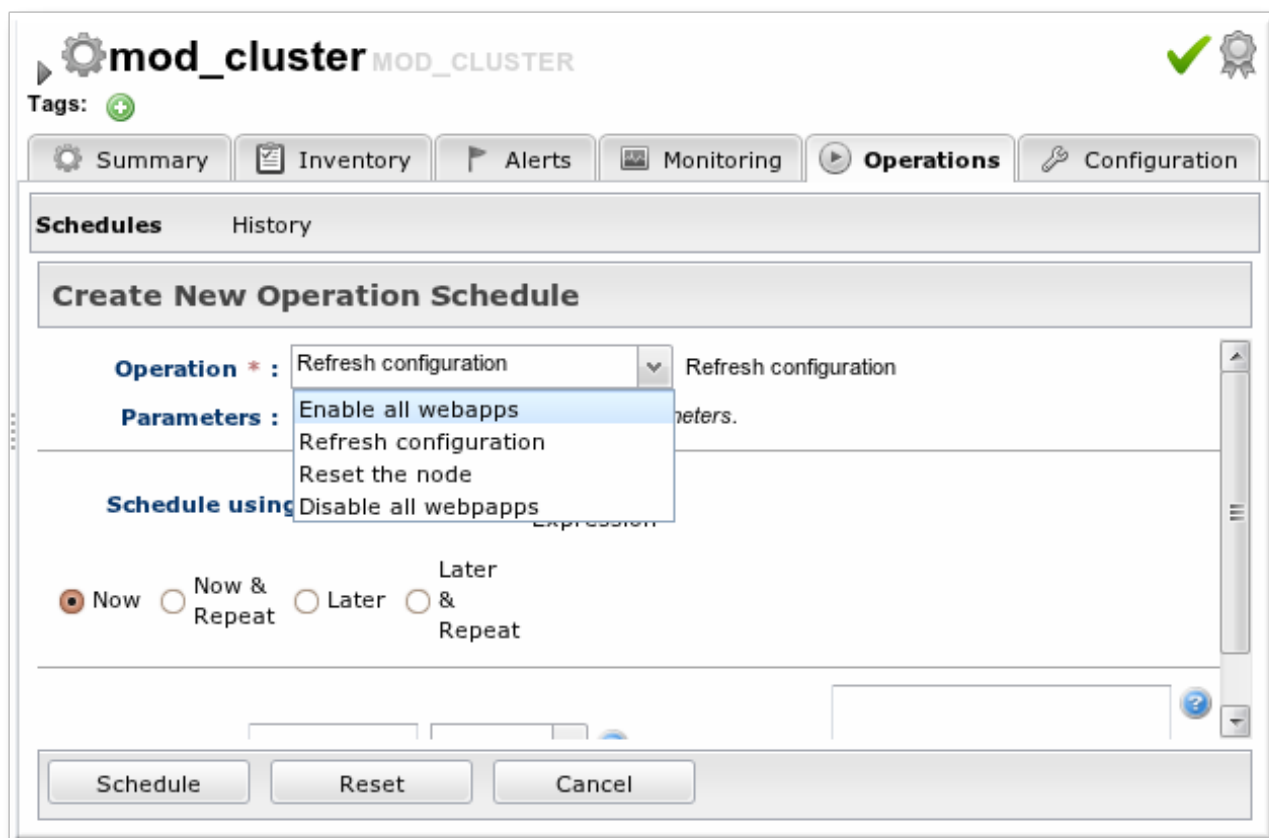

Figure 5. Running Server-Level Operations

4.3. Managing Web Applications Contexts

JBoss ON manages the full lifecycle of web application contexts within the **mod_cluster** load-balancing cluster.

Web application contexts can be stopped or disabled. Stopping or disabling a webapp context removes it from load-balancing balancing so that the Apache server cannot forward requests to the webapp, but it leaves the application running and available directly from the JBoss server address. (Stop allows the webapp context to drain before removing it from the load-balancing, so this essentially shuts down the webapp gracefully. It can take several minutes or even hours for the webapp context to stop. Disabling a webapp context immediately removes it from load balancing.)

JBoss ON has operations that allow JBoss administrators to manage the state of their web contexts within the **mod_cluster** domain.

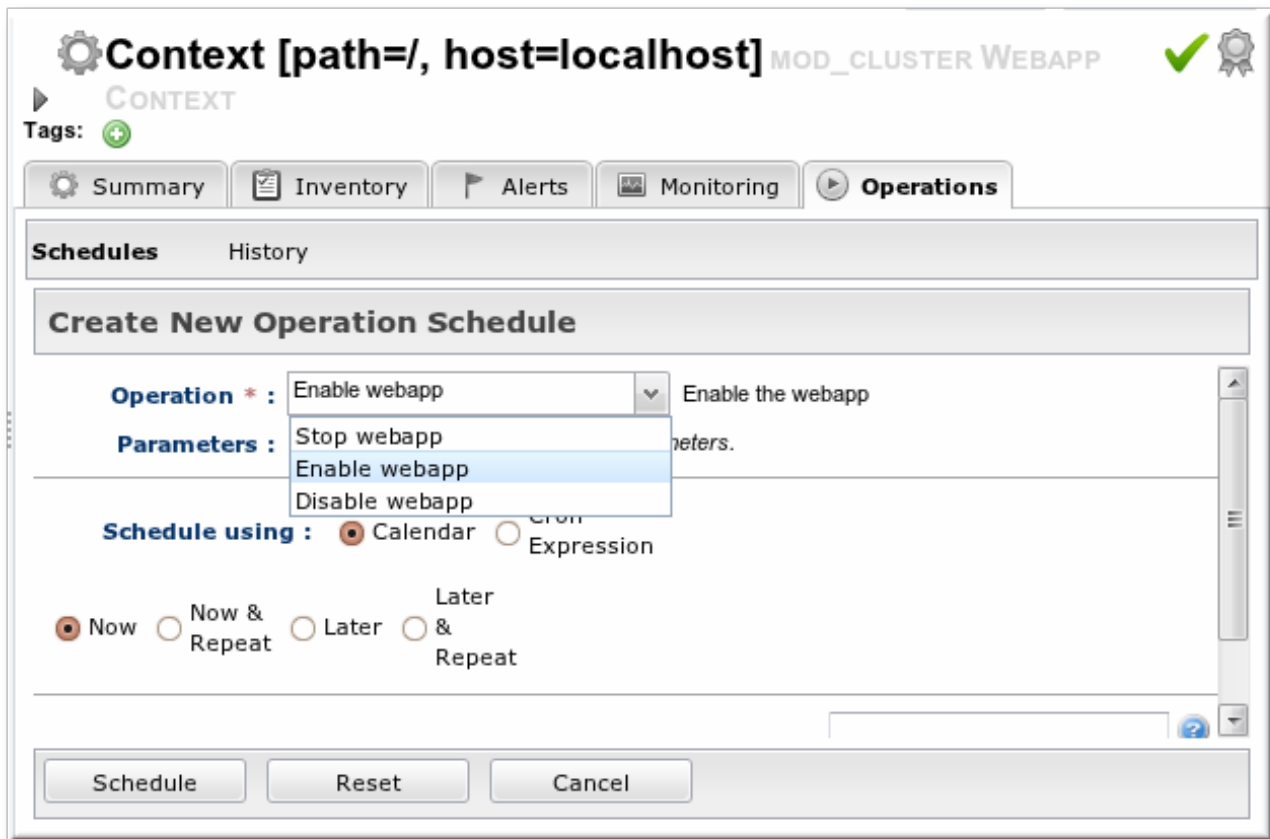

Figure 6. Running Web Application Context Operations

Web context resource operations only apply to the specific selected context.

5. DOCUMENT INFORMATION

This guide is part of the overall set of guides for users and administrators of JBoss ON. Our goal is clarity, completeness, and ease of use.

5.1. Giving Feedback

If there is any error in this guide or there is any way to improve the documentation, please let us know. Bugs can be filed against the documentation for the community-based RHQ Project in Bugzilla, <http://bugzilla.redhat.com/bugzilla>. Make the bug report as specific as possible, so we can be more effective in correcting any issues:

1. Select the **Other** products group.
2. Select **RHQ Project** from the list.
3. Set the component to **Documentation**.
4. Set the version number to 3.0.
5. For errors, give the page number (for the PDF) or URL (for the HTML), and give a succinct description of the problem, such as incorrect procedure or typo.

For enhancements, put in what information needs to be added and why.

6. Give a clear title for the bug. For example, "**Incorrect command example for setup script options**" is better than "**Bad example**".

We appreciate receiving any feedback — requests for new sections, corrections, improvements, enhancements, even new ways of delivering the documentation or new styles of docs. You are welcome to contact Red Hat Content Services directly at docs@redhat.com.

5.2. Document History

Revision 3.0-5**2013-10-31****Rüdiger Landmann**

Rebuild with publican 4.0.0

Revision 3.0-0**December 5, 2011****Ella Deon Lackey**

With the initial release of JBoss Operations Network 3.0.
